No Date.—**Glamorgan.**—The C.C. is to appoint an Architectural Assistant in the County Schools Architects' Department. Particulars of age, qualifications, experience, &c., to Mr. D. Pugh Jones, County Architect, County Hall, Cardiff.

Northern Counties Building Trade Federation.

The Northern Counties Federation of Building Trades has elected Councillor John Carse as President for the ensuing year. Councillor Carse is an Associate of the Institute of Builders, a member of the Institute of Hygiene, and also a member of the Newcastle Society of Antiquaries. The firm of Messrs. R. Carse & Son, builders and contractors, of Amble and Morpeth, of which Councillor Carse is senior partner, was founded in 1848. Councillor Carse, along with other local builders, formed the Midland and Northumberland Master Builders and Allied Trades Association and was its first President. Mr. Carse was elected a member of the Morpeth Town Council in 1922.

Wages in Building.

The National Wages and Conditions Council for the building industry met in London recently, and considered the application of the Operatives' Federation for an increase of 2d. per hour in the wages of all building trade workers.

The operatives ask that the cost-of-living index figure shall be readjusted, and that the provision in the agreement which relates to the base rate or starting point of the sliding scale shall be made to give an automatic advance of 2d. per hour. It is contended that under the operation of the scale wages have been brought down lower than the present cost of living justifies. Several other claims have been made, with the object of removing hardships in working conditions, such as the abolition of differential rates among craftsmen, and particularly painters, who, in some centres, receive 1d. an hour less than other craftsmen.

The council is also considering an application from the men's side to revert to the 44-hour working week. The national agreement has been modified by the arbitrator's award, and the effect of the application, if granted, would be to alter the awards of the arbitrator on hours and wages. Evidence for the operatives was given by Mr. J. Murrey; and for the employers by Messrs. H. T. Holloway, H. Blackman, and F. A. Wall.

"Quantity Surveying for Builders."

Messrs. Chapman & Hall, Ltd., write us in reference to our review of Mr. Evershed's book ("Quantity Surveying for Builders") in our issue of January 18, as follows:—

"We have perused with much interest the review of our new publication, 'Quantity Surveying for Builders,' by Mr. Evershed, which was in your issue for January 18. There is one small point that we should like to mention. We believe that the reference therein to clerical errors in examples Nos. 31 and 32 concerns the 'dotting' of certain ciphers. By an unfortunate accident on the part of the printers these dotted ciphers dropped out during machining, and as the author had checked them in the press proofs he, of course, had no control in the matter. He noticed it immediately copies reached him, and we have had a cancelled sheet printed, as shown by the enclosed, so that all copies now on sale are correct. We regret that we were not in time, however, to send these out to the reviewers."

PROPOSED NEW BUILDINGS & OTHER WORKS.*

In these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building owners taking the responsibility of commencing work before plans are finally approved by the local authorities, "proposed" works at the time of publication have been actually commenced. Abbreviations:—T.C. for Town Council; U.D.C. for Urban District Council; R.D.C for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; L.C.C. for London County Council; B.C. for Borough Council; and P.C. for Parish Council.

YORK.—The Health Committee has prepared an improvement scheme under which it will schedule an area of slum property extending from George-street to Hope-street, between Walmgate and the city wall, as an unhealthy area. It is proposed to demolish the buildings when acquired as equivalent accommodation is secured elsewhere for 805 persons. The estimated cost of acquiring the land and buildings is £7,522, and for erection of dwellings for re-housing, land, roads, and sewers, £73,890—a total of £81,412.

FIRES.

HARTLEPOOL.—Damage to the extent of about £5,000 has been done by a fire at the pattern storing shed at Messrs. Richardsons, Westgarth & Co.'s Hartlepool Engine Works.

HUNTINGDON.—The extensive motor-body works of Messrs. Maddox & Sons, have been burned out, the damage amounting to between £30,000 and £40,000.

SOUTHPORT.—Thousands of pounds worth of damage was recently done by fire at Scarisbrick Hall, near Southport, the residence of Sir Talbot Scarisbrick.

THE RATING BILL AND THE L.C.C.

THE Reports of two Committees of the London County Council, the Finance Committee and the Local Government Committee, were referred to in *The Times*, January 29, and from the very brief report contained in *The Times* it appears that the latter Committee reports that the proposal to adopt that part of the London system whereby the gross value is made conclusive for the assessment of income tax, schedules A and B, should not be extended throughout the country without important modifications. The full report will be awaited with interest, but this expression of opinion appears very important, seeing that London at present is the only area where such a system is in force.

This Report, like that of the Land Owners' Association, which we referred to in our issue January 18, approves the abolition of parochial rating, whereas the Poor-Law Unions Association (see *The Builder*, December 14) objected to this but seemed tacitly to accept the one common assessment for rates and income tax. The Land Owners' Association, inferentially at least, disapproved of the common assessment, and therefore appears in aggreement with the Local Government Committee on this point. Another important point on which the two latter reports appear in agreement is as to the rating of owners, at least, so we gather, from the summary of the Report, but it is not very clearly expressed. The Land Owners' Association deprecated the extension of any system rating owners instead of occupiers, but on this point the summary of the Report of the Local Government Committee is worded as follows:—"That amendment of the law relating to the rating of owners instead of occupiers is imperative," and we take this to mean that occupiers should be rated.

Stolen Mails.

Owing to the mails, which were delivered to Essex Wharf, Canning Town, on the afternoon and evening of February 2nd, having been stolen, Messrs. J. H. Gankey & Son, Ltd., ask those who wrote to them at that time to repeat their communications, if necessary,

The Institute of Builders.

The annual dinner of the Institute of Builders will take place at the Hotel Victoria, Charing Cross, on February 27, at 7 p.m.

Darvel.—Houses.—Various works in connection with erection of houses under their housing scheme. All information from Mr. J. E. Gibson, Town Clerk, Darvel, Scotland.

THE SCOTTISH BUILDER

NEW BUILDINGS IN SCOTLAND.

Glasgow.—Church.—The Corporation has been recommended to offer a site at Mosspark to the Home Mission Committee for the erection of a church.

Hamilton.—Houses.—The Scottish B.H. has approved of the erection of 20 houses, which John Dalziel & Sons propose to erect in William-street, Hamilton.

Alexandria.—Church.—The congregation of St. Mary's R.C. Church has bought Ferryfield Works, Alexandria, with ground adjoining, as a site for a church and chapel house.

Crossgates.—Institute.—The Crossgates War Memorial Committee has arranged to purchase the old school at Crossgates, and the Miners' Welfare Fund has agreed to reconstruct it for a welfare institute.

Edinburgh.—Infirmary.—The Royal Infirmary Board proposes to acquire George Watson's Boys' School for the extension of the Infirmary.

Airdrie.—Houses.—The T.C. has accepted offers for the erection of 36 new houses in Burnbank-street district. The total cost was stated to be £11,652, the cost per block of four houses £1,294, and the cost per house £323.

Troon.—Houses.—The Dean of Guild Court has passed plans as follows:—Mrs. J. Fullarton, 199, Southbrae Drive, Scotstounhill, Glasgow, house in Boagend-road, estimated to cost £1,400; Mr. H. Shaw, builder, East Union-street, houses in Bentinck Drive and Bentinck-crescent, at an estimated cost of £3,000, and a double cottage in Morven Drive, at an estimated cost of £1,500.

St. Vigeans.—Church Hall.—The members of St. Vigeans Church have approved of the erection of a new hall at St. Vigeans, near Arbroath. The plans have been prepared by Mr. Hugh Gavin, architect, Arbroath, and the cost, exclusive of furnishing, is estimated at £1,600.

Roadmeetings.—Hospital.—The Upper Ward District Committee of the Lanarkshire C.C. has agreed to a hospital at Roadmeetings, Carluke, at a cost of £42,000.

Cumnock.—Houses.—The T.C. has adopted plans for 24 houses to be built by the Council. The plans were prepared by Mr. W. Cowie, architect, Ayr.

Dunbar.—Houses.—The T.C. has received sanction to erect four additional houses.

BYZANTINE ARCHITECTURE.

The Rev. J. Arnott Hamilton, B.D., Fellow of the Scottish Ecclesiological Society, read a paper recently before the Scottish Ecclesiological Society, at Lansdowne Church Hall, Glasgow. The Rev. A. Boyd Scott, M.C., B.D., presided.

In the course of his paper on "The Origin and Development of Byzantine Architecture," he defined Byzantine architecture as that style which, having evolved during the course of preceding centuries, finally took on its definite characteristics in the days of the Emperor Justinian during the sixth century A.D. Several influences helped to mould it, and these proceeded from diverse quarters, but it was the capital of the Eastern Empire, Constantinople, which organised its distinctive features. Examples of Byzantine architecture were widespread, but a distinction must be made between buildings which were Byzantine in construction and others which were so only in some of their details, their plans being Basilican. The characteristic feature of a Byzantine church was the central dome, covering a square space on the ground floor. It was supported by squinch-arches or by pendentives, the latter being the normal Byzantine method. The dome with pendentives was used largely by the Christian architects of Asia Minor, and that part of the world might be said to be the cradle of Byzantine architecture.

The lecturer traced the development of the Byzantine style in different countries, and the impression, he said, given by the interior of a Byzantine church was one of tranquillity—a profound sense of peace and calm—as contrasted with the feeling of aspiration which attached to Gothic.

Mr. Alexander M'Gibbon, in the course of an appreciation of Mr. Hamilton's paper, mentioned Brixton Parish Church, London, as an interesting example of the Byzantine style in this country.

The Rev. W. Napier Bell, M.A., accorded a vote of thanks to Mr. Hamilton.

Forty Millions for Housing?

Speaking in Glasgow recently, Mr. James Stewart (Under-Secretary of Health for Scotland) said he had used his powers and had informed the Glasgow authorities that they would not be allowed to build houses in excess of 24 to the acre. In the housing schemes which the Glasgow Corporation had in view to make way for slum clearances, they wanted to build 48 to the acre. If the Corporation carried out its threat not to build under the conditions he laid down, the Government would ask Parliament in their new Bill to give them powers to build houses themselves.

When the Labour Party built houses, they would see that the people who built them would occupy them at rents from £14 to £15 per annum. When their whole scheme was completed they anticipated that the State would have to bear a burden of £40,000,000 per annum for housing. That was not much considering they paid more every day in interest on the war debt. The Government also intended to take power to deal with the trusts.

BUILDING TRADE WAGES IN SCOTLAND.*

The following are the present rates of wages in the building trade in the principal towns of Scotland. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur:—

	Masons.	Brick layers.	Carpenters, Joiners.	Plasterers.	Slaters.	Plumbers.	Painters.	Brick-Masons' Labourers.	Plasterers' Labourers.

THE BUILDER

A JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

VOL. CXXVI.—No. 4228. FEBRUARY 15, 1924

THE FINE ARTS COMMISSION.

THE intention of the late Government in creating a Fine Arts Commission for this country is to be commended, and whatever difference of opinion there may be regarding the constitution and scope of the Commission, we owe thanks to those who have been responsible for getting the Government to act at all. For many years the standard of taste—or rather the absence of it—has been a disturbing factor to many thoughtful people, and the student of social history will record this new and well-intentioned movement as a distinct step, so far, towards the humanising of civilisation. It is possible that in most discussions upon the subject too much stress has been laid upon the hopeless state of public taste, as if the public were wholly responsible for all the disfigurements which we have to tolerate. Certainly, in many matters it will be found that the public takes what it gets, and is assumed to be indifferent because it is silent. Morally, the responsibility lies with a public which indirectly encourages a low standard of taste, but, in point of fact, the average man is afflicted by a number of people who think they know what he likes and contrive to give it to him. The average man is blamed for many things, yet what he really thinks is more or less a mystery. We may assert that his thoughts are nebulous, for the most part, simply because he does not possess the necessary leisure for constructive thinking. Mr. Richard King, writing on the average man, says: "He is too much occupied by the problem of living ever to worry long over the problem of his being." It is always possible to be a little ahead of the public, and a grave responsibility rests on those who deliberately play down to what they think is the public level.

We have frequently urged the point of view that, as a nation, we have not been insensible to the fact that fine art is one of the things which adds to the nobility of life, but there has been a failure to recognise that the education of the individual as an end in itself is not sufficient to make an end of ugliness. We do not hold that the study of fine art is an intellectual pursuit or curiosity without any ulterior end, and that we should merely satisfy an intellectual need and not the interests of practical life. The study of fine art is a pure intellectual study, in so far as its aim is to satisfy the needs of the mind, and while we appreciate true culture which is cultivated for its own sake by the few, we believe that the opposite or negative extreme should be dealt with by legislation when there exists the power to do harm.

We raise the standard of public taste by education in the first instance, and, in time, feeling is translated into various forms of legislation as a preventive and a protection. In our social evolution we have demonstrated from time to time the necessity to safeguard health by numerous laws, and we believe that a high standard of civilisation would safeguard itself against many forms of ugliness. That the time will come when this will be done is beyond all doubt, and the step will be held to be indicative of a high standard of public taste.

The French Ministry of Fine Arts exercises a certain amount of control over public art, but we are following the example of America in setting up an Advisory Commission only. There is undoubtedly much to be said for adopting some such course, especially if facilities are afforded for a really representative Commission (such as that suggested by a correspondent in our last issue), even if we think that a certain amount of legislation is necessary to eliminate ugliness without going to the extreme of exercising control over public art. We will not enter into a philosophic discussion upon the difference between the control of taste in art and the control of ugliness; there is a wide field in which to work in the preventive sense, apart from the gradual building up of a higher standard of public taste.

The new Commission has no disciplinary powers, we are told, and it is merely a consultant body. It is, unfortunately, one of the freakish traits of the smallest Rural District Council that it seldom feels the necessity to desire help, or it takes a certain amount of local pride in ignoring expert advice. Anyone who is inclined to doubt this will find plenty of evidence in many of our small sea-coast towns. Experience will prove whether the advice to those who consult this new body will save us from the blunders arising from ignorance and vulgarity.

We read, for instance, that a certain seaside resort has printed 10,000 posters in nine colours, and that 400 posters 10 ft. square are to be displayed in prominent positions in the large towns. On a matter of this nature we do not suppose the local Council in question will ask the opinion of the Commission, nor do we suppose that the opinion of the large towns will be consulted. The most we can hope for is that science and common sense may in time make it clear that no health resort is an effective antidote to the evils it creates itself.

We frequently hear complaints from small sea-coast towns situated amidst beautiful scenery and commanding extensive sea views, that large sums of money are spent every year in "attractions" for summer visitors, yet every form of ugliness is allowed to go unchecked by the local authorities. We see hoardings and galvanised iron fences in prominent positions, and garden walls to the roadways being erected 10 ft. high with lean-to roofs against them entirely obliterating the beautiful views from the public. The whole problem is not a question whether anyone has a right to any unobstructed view; we merely record the type of intellect which can spend public money on advertisements and trivial distractions for pleasure-seekers and yet be helpless to preserve the simple amenities of life. Even if we take the "practical" type of mind, which only understands public expenditure in relation to boarding-house lists and gate receipts, we begin to realise that when common sense fails and the problem cannot be seen whole, there is cause for pessimism.

We are asked by a correspondent to tell him what hope the Fine Arts Commission has with a local builder who is also chairman of the District Council, and who owns a considerable amount of property in the town. That he is "his own architect and leaves a trail of ugliness behind him" we are prepared to believe, and we are inclined to agree with our correspondent when he says that the absence of local feeling publicly expressed is no reason why anyone should be allowed to destroy beauty and perpetuate ugliness. We would certainly like to see the councillor-builder setting a dignified and civic conception of the art of building as an example to all residents. We do not doubt the efficiency of our by-laws, but there is truth in the statement that the art of house-building may easily develop into the mere glorification of sanitary engineering. As Mr. Lytton Strachey says of Miss Florence Nightingale, "she seems hardly to distinguish between the Deity and the drains."

A representative Commission of the Fine Arts should do much excellent work, and should provide an excellent opportunity for architects to take a greater interest in local administration work—however distasteful—as a part of their larger responsibilities in life.

NOTES.

The Royal Gold Medallist. Many years ago an architect remarked to his friend that he had been sketching in the company of Lethaby and that he felt sure his consuming energy would finish him off quickly unless he abated his efforts. Well, Professor Lethaby is happily still with us and active in service for his fellows, and now we have the pleasure of congratulating him on his nomination as the recipient of the Royal Gold Medal. After the intimate and enthusiastic tribute paid to the Professor by his friends and admirers recently there is nothing fresh left to say but reiteration of his good services to the profession by the enforcement of high ideals. To some it may seem that such a high literary endowment has been attained by the sacrifice of actually executed designs of buildings, but probably Professor Lethaby has filled as honourable and useful a niche in the world's affairs as he could have himself wished. Our own readers have had ample opportunity afforded by his monthly contributions to our pages for some years past of estimating his high quality as a suggestive and original thinker.

An International Congress of Architectural Education. The public discussion of the subject of architectural education appears to have been somewhat neglected recently, though we believe much careful thought has actually been given to it by the Board of Architectural Education and others since Mr. T. E. Collcutt read his paper before the R.I.B.A. a year or two ago. His criticisms took the form of a bold attack on some present-day methods, and were supported, we believe, by a good many architects, who consider that the proper education of architects is of more immediate importance than the education of the public to a better understanding of architecture—that it is, in fact, the only way to that understanding. Probably more would have followed from Mr. Collcutt's address had it not been already decided to hold an International Congress on Architectural Education at a later date. This date has now been fixed for the end of July, and from the particulars we give on p. 250 it will be seen that a very strong Committee has been formed to carry out the necessary arrangements. The Congress will be of great interest, and will no doubt have important results for the profession.

The R.I.B.A. and the National Housing Policy. The important memorandum which the R.I.B.A. has issued, and which we print on p. 267, contains the opinions of the Institute, and, we hope, of most practising architects, on the urgent question of housing. In the course of the memorandum the chief difficulty in the way of making a proper provision for the housing of the working classes—*i.e.*, money, materials and men—are enumerated and suggestions are made in regard to each. It will be noted that the Institute recognises that financial assistance is granted in order to provide dwellings of the minimum standard at a rent which the occupants can pay, but we are glad they emphasise the importance of a high standard of housing as an essential condition. We are all committed now to the policy of financial aid, and we may well ask for an improved standard as a condition.

Institute Politics. Anent the discussion in the current issue of the R.I.B.A. *Journal*, on election to Fellowship, how shall one treat fairly the position of those who have earned the credential as Associates of the R.I.B.A. in regard to the present proposals of change? Is it the welfare of the architect, or the good of architecture, or both, which should discount opposition to the proposed changes and amalgamation of societies? Theoretically we may claim that the good of the art is of more import than the welfare of its practitioners, but we must, of course, be fully satisfied as to what is for the good or the welfare. A pertinent remark on the situation may be, "Don't cry out before you are hurt."

The Fine Arts Commission One of the conditions attached to the Fine Arts Commission is that after the first three years from its establishment two members will retire in turn each year, but will be eligible for reappointment. Past experience teaches us what to expect under these conditions. In the distant future the Commission may consist of nine old gentlemen, most of whom never attend at all, and all of whom hold their places automatically. Death alone will cause a vacancy. If this Commission is to be of the slightest real use there must be some guarantee of fresh blood. We suggest that the senior of the retiring two should not be eligible at any date for re-election. We hope that the Government and the Commission itself will see the necessity of providing some such safeguard as we suggest.

The Queen's Dolls' House: The Garden Front (5 ft. wide).
Sir Edwin L. Lutyens, R.A., Architect.

London Plaquette Competition.
"London as the Capital of the Empire."
By Miss M. Kitchener.

Charing Cross Bridge.

It is to be hoped that there will be a good attendance at the Institute next Monday evening, when Mr. Paul Waterhouse reads a paper on Charing Cross Bridge, expecially of those who have influence over public and official thought. In a matter so greatly affecting the appearance and convenience of London we must all hope for the right solution of the problem. There is something more in it than the building of a fine bridge or viaduct, for its exact position and approaches are of the greatest importance. We can all admire a great viaduct or aqueduct across an open valley, but a city viaduct is a very different matter and can never be undertaken without detrimental influence on the property over which it passes and round about it. A correspondent, writing to us, says "in the case of a viaduct at Charing Cross not only is there to be considered the detrimental influence on the property about it, but there is the cutting off of the splendid vista of gardens and embankment from Waterloo to Westminster, which is one of the finest things in London. In the design for a low-level bridge it has already been shown (by Mr. Caröe) how a 'dive' under the new low-level bridge might carry through the embankment traffic, and in reference to the safe-guarding of fixed tram-lines no one can predict that any will be in existence in 50 years' time."

The Importance of the Bridge.

Whether in regard to the convenience or the beauty of London, no expert student of City development can have any doubt of the vital importance of a great road bridge at Charing Cross. That this should have been foreseen and provided for many years ago is obvious enough, and if it had been the derelict mud banks on the south side of the river might have disappeared long ago. No one with any fair degree of imagination can forget the magnificent possibilities which the Thames in its passage through London has provided. Hanging gardens with terraces and trees, fine hotels, offices, and residential flats might have lined the river from Westminster to Blackfriars; in fact, one could almost imagine that London might have been as fine as Dresden!

County Hall Mural Art.

Though we are sorry that the scheme for decorating the County Hall with so-called mural paintings has miscarried, we are more impressed by the arguments of Mr. Andrew T. Taylor in his letter to *The Times* than with those of the promoters of the scheme. The proposals for these paintings came, we believe, in the first instance from the masters of the four art schools themselves as combining the advantages of cheap art with that of furthering the cause of mural decoration. Mural art was to be better promoted, in their view, through employing students than by artists. These paintings have been in the end declined, "with only one dissentient voice." It seems curious to set out to promote mural decoration by employing students "because artists are so expensive," as we have heard it said. We have some difficulty in accepting a view which establishes itself by putting the cart before the horse. To many artists the proposal came as an affront, and Mr. Muirhead Bone, in telling us that "established, but not necessarily better, artists would not have been thus cavalierly treated" does not seem to realise that this is precisely how they have been treated. The conception of artists as popular landscape and portrait artists suggests a rather limited acquaintance with the resources available from which to draw. The fact must be admitted that the whole scheme has been very unwisely directed. It has offended artists because its approach was likely to bring mural art into contempt. It has been unfair to the students who have been the catspaw of this enterprise, while exposing the schools to the criticism that their ideas about mural art are based on a misunderstanding of its nature.

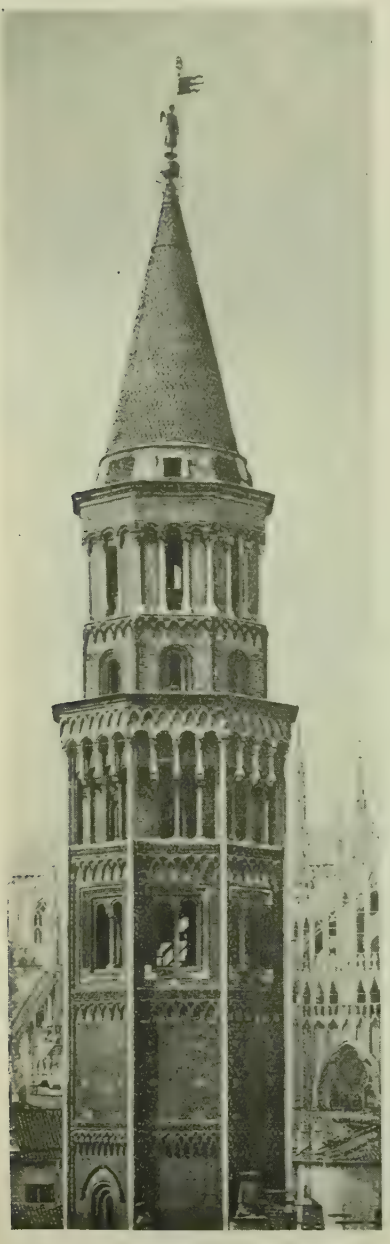
"Burnt Stub," Chessington: Loggia. Mr. Leonard Martin, F.R.I.B.A., Architect. (*See p.* 256.)

GENERAL NEWS.

Professional Announcement.

Mr. M. J. H. Somaké, F.S.A., recently arrived from abroad, has opened practice as architect and surveyor. Manufacturers, &c., are invited to forward catalogues of building and engineering specialities to "Mossville," 284, Cricklewood-lane, London, N.W. 2.

Change of Address.



The address of Messrs. Wheeler & Sons is now St. Stephen's House, Westminster, London, S.W.1. Telephone: Victoria 6539.

Architect's Estate.

Mr. Edward Simpson Butterworth (81), of The Gables, 106, Tweedale-street, Rochdale, Lancs, retired architect (net personalty £15,470), £19,918.

St. Paul's Ecclesiological Society.

This Society, which during the past year has given a number of papers and lectures on church architecture, and visited various churches of archæological interest, will hold its forty-fifth annual meeting at the small hall, Bishopsgate Institute, on February 16, at 4 p.m.

Tower of Gottardo, Milan.

Faraday Medal.

The Council of the Institution of Electrical Engineers has made the Third Award of the Faraday Medal to Dr. S. Z. de Ferranti, a past-President of the Institution. The Faraday Medal is awarded by the Council of the Institution not more frequently than once a year, either for notable scientific or industrial achievement in electrical engineering, or for conspicuous service rendered to the advancement of electrical science without restriction as regards nationality, country of residence, or membership of the Institution. Dr. Ferranti was a pioneer in the supply of electricity, and his early grasp of the fundamental principles of electric power supply have had a profound influence not only in this country but all over the world.

Management of Landed Estates.

Mr. A. J. Burrows gave the second of his lectures on this subject at the College of Estate Management recently.

In this lecture the lecturer continued his description of the work of a land agent dealing with insurance. He showed how the land agent must consider his work both from the point of view of the amenities of the estate and also from the commercial side.

He then dealt with the other details of a land agent's duties, and emphasised the necessity for the organisation of each of the departments of the estate on business lines, giving valuable advice as to the best methods of running each of the varied sections of a big country property.

Architects' and Surveyors' Assistants' Professional Union.

The Metropolitan Branch of the A. & S.A.P.U. held their annual dance at Australia House recently. There were about 180 present, including Mr. C. McArthur Butler (Secretary, Society of Architects), Mr. F. R. Yerbury (Secretary, Architectural Association), Mr. R. G. Strachan (General Treasurer, A.S.A.P.U.), Mr. Charles McLachlan, A.R.I.B.A., (Chairman, Executive Committee, A.S.A.P.U.), and Mr. J. Mitchell (General Secretary, A.S.A.P.U.).

Board of Architectural Education.

The arrangements for the International Congress on architectural education, which will be held at the R.I.B.A. from Monday, July 28, to Friday, August 1, 1924, are in the hands of an executive committee under the chairmanship of Mr. Maurice E. Webb, M.A. The following have consented to serve on the Committee:—Sir Reginald Blomfield, R.A., Litt.D., Sir John J. Burnet, A.R.A., R.S.A., Lt.-Col. H. P. Cart de Lafontaine, O.B.E., Mr. Arthur J. Davis, Mr. G. Topham Forrest, F.R.S.E., F.G.S., Mr. W. Curtis Green, A.R.A., Mr. Stanley H. Hamp, Mr. Arthur Keen, Professor Beresford Pite, Hon. M.A., Mr. W. S. Purchon, M.A., Professor C. H. Reilly, O.B.E., Professor A. E. Richardson, Mr. Howard Robertson, S.A.D.G., Mr. H. D. Searles-Wood, Mr. Evelyn Shaw, M.V.O., Mr. Paul Waterhouse, M.A., F.S.A.

Mr. Henry M. Fletcher, M.A., is the Hon. Secretary.

The Congress will consist of meetings for papers and discussions, visits, receptions, and a dinner. An Exhibition of students' work will be held, and it is hoped to be able to arrange for accommodation for the exhibits in Devonshire House, Piccadilly, in addition to the galleries of the R.I.B.A., 9, Conduit-street, W.1.

R.I.B.A. Prizes and Studentships.

The Juries for 1924 have been appointed as follows:—

THE ROYAL INSTITUTE ESSAY PRIZE.—The Chairman of the Board of Architectural Education, Mr. Lionel B. Budden, Mr. S. D. Kitson, Professor Beresford Pite, the Critic.

THE TITE PRIZE.—The Chairman of the Board of Architectural Education, Mr. Robert Atkinson, Mr. Fernand Billerey, Professor C. H. Reilly, the Critic.

THE MEASURED DRAWINGS MEDAL.—The Chairman of the Board of Architectural Education, Mr. H. Chalton Bradshaw, Mr. Theodore Fyfe, Mr. Basil Oliver, the Critic.

FIG. 15.—S. TEODORO, PAVIA.

THE OWEN JONES TRAVELLING STUDENTSHIP.—The Chairman of the Board of Architectural Education, Mr. Arthur J. Davis, Mr. Gerald Moira, Mr. Halsey Ricardo, the Critic.

THE GRISSELL GOLD MEDAL.—The Chairman of the Board of Architectural Education, Mr. Donald Cameron, Mr. W. E. Vernon Crompton, Dr. Oscar Faber, the Critic.

THE GODWIN BURSARY AND WIMPERIS BEQUEST.—The Chairman of the Board of Architectural Education, Professor S. D. Adshead, Mr. Walter Cave, Mr. W. S. Purchon.

COMPETITION NEWS

Proposed Municipal Offices, Kent.

The President of the Royal Institute of British Architects has nominated Mr. H. V. Lanchester, F.R.I.B.A., as assessor in this competition.

Royal Masonic Institution for Boys: Junior School, Bushey, Herts.

The drawings submitted by architects in the limited competition for a Junior School for Boys at Bushey, Herts, will be on exhibition in the board-room at the offices of the Institution, 26, Great Queen-street, W.C.2, between the hours of 10 o'clock and 5 o'clock from February 18 to 22. Members of the profession will be admitted on presentation of their cards.

Masonic Peace Memorial.

For full particulars of this competition see our issue for February 8. No sending-in date has yet been fixed.

Ebbw Vale Memorial.

The Memorial Committee will consider designs and quotations for the erection of a piece of statuary. Closing date, February 23. Particulars from Mr. B. Thomas, London Hotel, Ebbw Vale, to whom designs must be sent.

Other Competitions.

Other competitions still open include the following (the dates given are, first the sending-in date, and second the issue of *The Builder* in which full particulars were given):—Essays on Heating and Ventilating (Mar. 31; Nov. 9, 1923). Industrial Designs (June; Dec. 21, 1923). National Theatre (April 26). Monument to Sir Wilfrid Laurier (April 3; Dec. 14, 1923). Belfast Union Lighting (March; Nov. 9, 1923). Dunfermline War Memorial (March 8; Dec. 28, 1923). Newcastle Concert Hall (March 1; Oct. 26, 1923). Ross-Smith Memorial (Sept. 30; Feb. 1). Newcastle Fire Station (March 27; Feb. 1).

TOWERS AND SPIRES.

By SIDNEY TOY, F.S.A., A.R.I.B.A.

VI.—ABBEY OF CHIARAVALLE.

The central crossings of the larger churches built in Lombardy from the eleventh to the thirteenth century were usually covered by domes. The crossings were spacious and it was therefore necessary that the thrusts of their vaults should be exercised at as low a level as possible. Again, since the windows in the naves of these churches were narrow and few and the internal effect, even under Italian skies, sombre, it was desirable that the crossing should be well lighted. This was effected by the construction of an octagonal lantern over the space, pierced by windows of sufficient size and number to flood the crossing and ciborium with high light, and covered by an octagonal dome, as at S. Ambrogio, Milan (Fig. 14). The walling and main body of the structure was usually of brickwork.

At S. Ambrogio,* Milan, and the churches of S. Michele, S. Pietro in Ciel d'oro, and S. Teodoro, at Pavia, all dating from the twelfth century, in respect to their domes, the octagonal lantern rises directly above the four arches of the crossing by means of four wide squinch arches. Often the brickwork of the squinch arches is ingeniously constructed. At S. Michele, Pavia, the arch is trumpet-shaped and the brick courses, tapering as they pass from the outer face of the arch and becoming inconveniently thin as they approach the angle, are stopped on a wide splay, the splay itself being carried on a smaller squinch at a lower level. The latter is constructed of alternate courses of brickwork and stone. The windows of the lantern were usually pierced in the four walls on a level with the squinch arches, as at S. Teodoro, Pavia (Fig. 15), but at S. Ambrogio, Milan, they were formed in the dome itself. Externally the lantern appeared as a low octagonal tower with a pyramidal roof covered with tiles. The broaches over the squinch arches, with their tile coverings, are fixed well above the roof-line of the church and above them, springing from the base of the dome, is an arcaded drum, which carries a timber roof. Occasionally the arcade is open and the dome within exposed, as at S. Ambrogio, Milan, but it is usually blind, as at S. Teodoro (Fig. 15).

This was the early form of covering for the crossing adopted and pursued in Lombardy during the eleventh and twelfth centuries. But in the early years of the thirteenth century a tower and spire was developed from this nucleus which attained a degree of elegance of form and virility of construction hardly surpassed elsewhere; and this while accepting the conditions of spaciousness and lighting laid down and followed by the preceding builders. An early step in this development is seen in the church of S. Teodoro (Fig. 15). Here the lantern and dome are of the usual form, but upon the dome a second and much smaller lantern, with twin lights, is built. This had the object of increasing the dignity and importance of the structure as seen from without. A further advance, on a more elaborate scale, was made in the tower over the crossing of the church of S. Andrea at Vercelli, founded in 1219. This is a true tower and projects high above the roof of the church in two stages crowned by a spire. Though the lantern over the crossing is very lofty, the squinch arches are placed in the usual position on a level with the heads of the great arches of the crossing, and the tower is octagonal throughout from this point. A gallery is carried round the interior immediately above the squinch arches; and the walls, pierced only on the cardinal sides by a circular light about midway and a narrow window at the summit, are carried to a considerable height and enclosed by a ribbed vault. Decorative relief is added by angle-shafts with carved capitals which rise from a string-course round the gallery to the ribs of the vaulting, and by others in the square angles of the crossing between the capitals of the great piers and the trumpet-shaped squinches. The second stage of the tower is much smaller in width and rests upon the vault of the lantern. It is pierced by two tiers of windows and the spire above is surrounded by eight pinnacles which rise from the centre of the walls at its base.

Doubtless the finest production of this school is the magnificent tower over the crossing of the Abbey of Chiaravalle, near Milan (Fig. 16A). The church was consecrated in 1221, as recorded on an inscription near by, and although several times repaired the tower remains substantially the same as when first built. It is constructed of terra-cotta and brick. As will be seen by reference to the section (Fig. 16B) the lower part of the tower forms a lantern entirely open to the spacious crossing beneath. The lantern is not relatively so high as at Vercelli and it is covered by a ribbed dome. Above the lantern the tower rises through four additional stages and is crowned by a tall conical spire. The construction of the support for the upper part deserves close attention. As is well known the weakest part of a dome is at its haunches, where it is liable to burst outwards by the acute thrust of the upper portion. It is necessary, therefore, in order to counteract this tendency, to load the dome here as well as at the base. In this case the system of buttressing is most elaborate. The principal weight of the tower and the spire it carries falls high on the surface of the dome, but its force is counteracted by the addition of a second wall to the lower stage, outside the other. The weight of this latter, assisted by the parapet above, and the thrust of the half-round arch built in the mass of the brickwork behind the haunches, falls much lower down on the surface. The effect is that the combined pressures are distributed over a much wider area and that they are adequately abutted by the mass of brickwork by which they are surrounded. The spire has been bound round with iron girdles in modern times. This tower owes its beauty in no small measure to the refinement of its details. The open parapets, while filling their role of adding loads where required, impart considerable delicacy to the whole and serve to soften the gradation, otherwise abrupt, of the one diminishing tier to the other. The ornamental arrangement of the brickwork decoration is also of great beauty. A later phase of this work is seen in the tower of S. Gottardo, Milan, built about 1330 (Fig. 17).

* There are no transepts at S. Ambrogio, Milan, and therefore no crossing, but the lantern stands over the east bay of the nave.

CORRESPONDENCE.

The D.B.M.S.

Sir,—In your last issue the Editorial on "The Labour Government and Housing" mentions the "disastrous attempt to make a corner in building materials for public benefit under the D.B.M.S."

As the first Director of that department I may be pardoned for asking what evidence there is to justify that statement. During my connection with the D.B.M.S. it was under the Ministry of Munitions and the policy laid down and acted upon was that it existed for the benefit of the building public generally, and not for the housing schemes only. At first, at least, the energies of the Department were directed to the encouragement of the manufacture of building material rather than to its purchase.

In October, 1919, I retired and the Department was transferred to the Ministry of Health. Of what happened after I left I know little more than the rest of the world, but, had there been a corner or anything like an attempt to make one, I think I should have been one of the first to find it out. J. E. Drower.

Westminster.

***The Government admittedly purchased very large quantities of materials with the intention of providing what was necessary for housing schemes for, as our Leader stated, *public benefit*. It is common knowledge that this scheme was not satisfactory, and resulted in great delay and often expense, because contractors had at times to purchase in the open market to keep men employed as they could not get delivery. The term "corner," we think, was used justifiably, coupled with the intimation that the intention was for the general good. We did not intend to cast any reflection upon individual officers of the Department, who, we are ready to concede, did their duties and much arduous work in difficult circumstances. What we blame is the system.—Ed.

Yes, We Have no Unification To-Day!

Sir,—With reference to the letter received by me, and I presume other Associates, from the R.I.B.A. Defence League, signed by Mr. A. W. S. Cross and Mr. Sydney Perks, may I ask whether we should not, as architects, be in a much better position to-day to press our views upon the Government in the new housing situation if the recommendations of the Unification Committee had by this time been carried out? Quite apart from registration the situation seems, in the form of question and answer, to be as follows:—

Question.—Does the Royal Institute, in this important matter, represent at the moment the whole of the architectural profession?

Answer.—No; but on the other hand we *have* now decided to wear pink costumes on academic occasions.

Hope Bagenal.

Reinforced Concrete Arches.

Sir,—I find that within the last 12 months a reinforced concrete bridge over the Mississippi, having *arches* of which the largest is 400 ft. span, has been completed. This structure is peculiar in having the steel reinforcement framed as riveted structural steelwork, as distinct from work which has round or deformed bars.

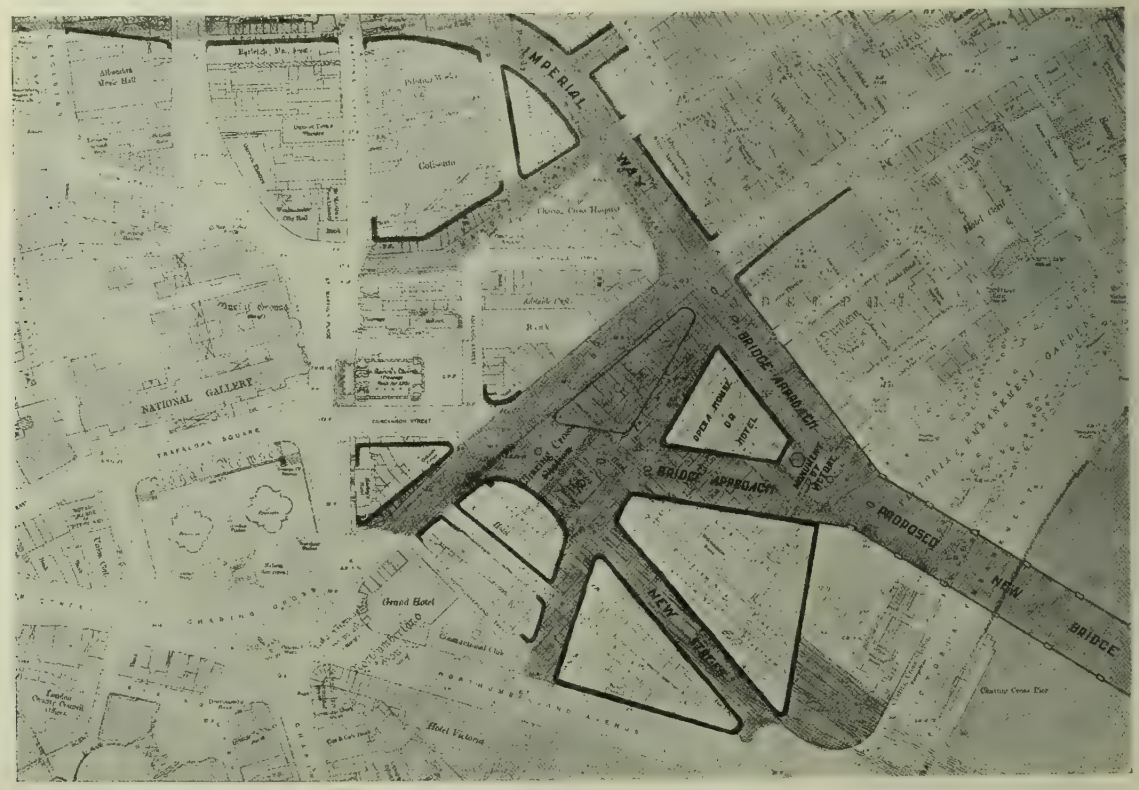

EXHIBITION NOTES

PORTRAITS.

One often feels inclined to ask why portraits are exhibited. It may be as portraits *qua* portraits, or it may be for their value as works of art. Those who like to study mankind would hardly find any exhibition of portraits entirely dull, but we imagine the aim of a portrait society goes beyond the mere setting forth of likenesses. We must say that we found the Exhibition of the Royal Society of Portrait Painters, at the R.A., interesting as to the character revelations of painters and their sitters, but aggressively irritating in the main effect. There are some exceptions, but taking the exhibition as a whole we should not like to think it was representative of the art of portrait painting in this country. Many of the good people who have sat for their portraits would doubtless, under certain conditions of light and colour, and free of intense self-consciousness, make subjects of excellent pictures were they treated with the quality shown by Fiddes Watt, in his "Portrait of a Gentleman" (No. 47), or the rare distinction of "Mrs. George" (No. 48) by Sir William Orpen; but the polished elegance of a high official, or the foolish effrontery of a simpering girl, need a great deal of the artist's reticence and grace to make them acceptable. How foolish and dull are the majority of these portraits compared with the admirable "Portrait of an Old Man" (No. 110), by Miss A. C. Tatham!

LANDSCAPE STUDIES.

Water colours, by Alex. Walker, at the Twenty One Gallery, show a sympathetic and tender handling of landscapes, and many of them have a pleasing sense of mystery, which adds to the interest. They are unequal in quality, but suggest a promise of much good work in the future—such a drawing as that of "Evening in Widdington" (No. 7) is a very complete and satisfying little picture.

Scheme for Approaches to the Proposed Charing Cross Bridge. By Mr. John Murray, F.R.I.B.A.

[This plan provides for one direct approach from Trafalgar-square *via* the Strand and Duncannon-street, and one approach from Piccadilly-circus *via* the proposed new Imperial-way. The Adelphi would be preserved lineable with and east of York Buildings. The existing Charing Cross monument and the Strand tube station would be left undisturbed in their present positions.]

THE LAW RELATING TO BUILDING.

By W. T. CRESWELL, Lic.R.I.B.A., F.R.S.I. (Barrister-at-Law).

VI.—CERTIFICATES. (1)

Duties of the Architect or Surveyor in relation to Certificates in use.

THE granting of certificates for payment, by instalments, to the contractor by the employer, is one of the duties of the architect or surveyor; and in this he assumes the rôle of a (1) quasi-arbitrator between the parties when the final certificate is granted (see Chambers *v.* Goldthorpe (1901) 1 K.B. 624), and that of (2) agent of the employer in the granting of "progress" certificates—that is, certificates for payment of a proportion of the value of labour and materials on the site, from time to time as the work proceeds, this proportion being originally defined in the contract (see Tharsis Sulphur and Copper Co. *v.* McElroy (1873), 3 App. cases 1040), where the Lord Chancellor said:—"The certificates I look upon as simply a statement of a matter of fact, namely, what was the weight and what was the contract price of the materials actually delivered from time to time upon the ground."

Final certificates state that the work has been completed, and the contract fulfilled, to the satisfaction of the architect or surveyor; and that he assures the employer that the contractor is now entitled to payment of the balance of his account, as finally adjusted. The assurance of approval of the architect or surveyor must be expressed in the manner customary, or in any particular manner originally prescribed in the contract under consideration.

The architect's or surveyor's decision of the amount finally due is essentially a matter of figures, but he must also show the exercise of knowledge, skill, and judgment in the result. And if the employer or contractor is dissatisfied, no action will lie unless fraud or collusion can be proved on the part of the architect or surveyor. In Stevenson *v.* Watson (1879), 4 C.P.D.148, Denman, J., said:—"To hold that an architect was a kind of appraiser or valuer to look at certain work, cast up certain figures, and do rather clerkly than judicial work or the work of an arbitrator which requires the exercise of skill and judgment, would be to ignore the experience of every member of the Bar and Bench who has had to do with building contracts—and as many of us have had great experience of them, we ought to take it into consideration."

In Chambers *v.* Goldthorpe (1901) 1 K.B. 624, the Master of the Rolls in his judgment said:—"The question raised is whether, in ascertaining and certifying the amount payable by the defendant to the contractor, the plaintiff (the architect) was in the position of an arbitrator between the building owner and the contractor, or merely in the position of an agent to the building owner. If he were in the latter position he would clearly be liable for negligence; but if he were in the position of an arbitrator, then, beyond all doubt, the building owner could not sue him for negligence, for in that case he would only be liable to an action on the ground of fraud or collusion."

Unless otherwise provided in the contract, a certificate must be given by the architect or surveyor himself, though he may, with discretion, delegate another to take measurements for his calculations of the amount to be certified (see Clemence *v.* Clarke (1879), reported in Hudson on building contracts, Vol. II, p. 41). An architect's or surveyor's certificate as to a contractor's right to payment will be conclusive, even if, on the face of it, it is founded upon measurements made by another person on his behalf, provided it is not shown that the architect or surveyor has acted corruptly or abdicated his duty.

Unless the contract so provide, it is not necessary for the contractor to give notice to the employer before applying to the architect or surveyor for a certificate, nor for the certificate to be in writing (see Coker *v.* Young (1860), 2 F. and F. 98). In Farmer *v.* Legge (1797), 7 T.R. 191 Kenyon, C.J., said:—"A certificate imports that the party certifying knows that he certifies."

It is usually made clear in the contract that the certificate of the architect or surveyor is necessary before, that is, it is a "condition precedent to," any payment to the contractor; therefore, except in very special circumstances, the contractor cannot recover payment without such certificate.

In Morgan *v.* Birnie (1833) 9 Bingham 672, the contract prescribed that all the proposed erections should be done in a good and workmanlike manner, and with good, sound, and well-seasoned materials; and be completed to the reasonable satisfaction of the defendant's architect. The architect checked the builder's charges and sent them to the defendant. It was held that this was not a certificate of the "satisfaction" of the architect, and therefore did not enable the builder to sue the building owner (the defendant), although the latter had not put forward as an objection to payment that the certificate as rendered was insufficient. Tindal, C.J., said:—"It appears to me that the effect of a certificate would be altogether different applying to the manner in which the work had been done; while the checking the accounts applies only to the propriety of the charges." See, too, Milner *v.* Field (1850), 5 Ex. 829. Here the contract provided that no instalments would be paid unless the plaintiff (the contractor) delivered to the defendant a certificate signed by the surveyor of the defendant stating that the works were performed according to specification. It was held that the lack of such certificate was a good defence in an action for recovery of instalments. The above described certificates are distinguished as "good" and "not good," as they fulfil the contract or custom or not.

Where the contractor has provided sureties for his due performance of the contract, and he, by any wrongful means, obtain a certificate for work defectively done, that certificate does not discharge him or his sureties (see Kingston *v.* Harding (1892), 2 Q.B. 494). But, of course, there is an implied contract that the architect or surveyor will not capriciously or fraudulently withhold a "good" certificate (see Ludbrooke *v.* Barrett (1877), 46 L.J. (C.P.) 798), where it was held that the contractor, having duly performed his contract, and the architect having refused to grant a certificate to that effect, the architect and employer had fraudulently withheld payment.

The architect's or surveyor's duties generally continue until such time as he has fulfilled those duties under the contract, even if the contractor shall have forfeited his rights. Therefore, if a contract provides that payment is to be made as soon as a certificate is obtained, and an architect honestly withholds such a certificate, then no action can be maintained by the contractor for the amounts he alleges to be due to him, since the architect or surveyor is in duty bound to use his discretion and act as quasi-arbitrator (see Botterill *v.* The Ware Board of Guardians (1886), 2 T.L.R. 621).

1. The power of the architect or surveyor to certify on all matters included in the certificate, as between the parties, and such power and authority must exist at the time when the certificate is given.

2. The intention of both parties that such certificate shall be binding.

3. The certificate must be on such matters as call for the skill and judgment of the architect or surveyor; also, if it is honest and not fraudulent (in which case it is void), it still holds if it be not skilfully or accurately made.

4. It must be given without any unfair influence or interference and before any dispute has arisen.

5. It must be given, if so required in the contract, after the ascertainment of the facts upon which the power to give a particular certificate arises.

6. The certificate must plainly show its finality.

The architect's or surveyor's certificate cannot be set aside except in very special circumstances. It may be impeached for fraud or collusion, but cannot be questioned on the grounds of negligence, mistake, or idleness on the part of the architect or surveyor; indeed, if his certificate is intended to be binding, his ignorance or incompetence does not make the certificate void. It therefore follows, that if anyone employs an architect or surveyor who does not know his work, and who honestly certifies his satisfaction when he should not have been satisfied, such employer must take the full consequences of his choice of an architect or surveyor in matters where he has given the architect or surveyor power to act either by special contract or according to custom (see Goodyear *v.* The Corporation of Weymouth (1865), 35 L.J.(C.P.)12).

ILLUSTRATIONS.

Stockton War Memorial.

This monument, which is built of Portland stone and rests on a reinforced concrete foundation, is raised upon three steps, immediately above which is a stone seat or base for the disposal of wreaths. The podium is crowned by a moulded capping from which rises the columned shaft of the monument. The plan of this is practically square, with curved ends and detached columns standing in front of semi-circular recesses. On the face of the shaft is a large bronze panel, enclosed by a reeded border, and bearing the Arms of Stockton-on-Tees contained in a wreath, and other decorations, with the inscription in raised lettering. The back of the shaft is ornamented by the Arms of the town carved in stone, within a wreath.

The general contractors were Messrs. Fenning & Co., Ltd., Palace Wharf, Rainville-road, W.6. Models for the bronze work were prepared by Mr. George Alexander, while the bronze panel, wreaths, urn, and wrought-iron railing enclosing the space occupied by the monument, were made by Crittall-Freeman Bronze, Ltd.

Part of the memorial consists of a vellum "Book of Remembrance," written and illuminated by Miss Price, Holmwood, and bound by Mr. Harold Pain. It is preserved in the adjacent Parish Church, in an oak desk made by Mr. Laurence Turner.

The whole of the work was designed and superintended by the architects, Messrs. Lanchester, Lucas & Lodge, 19, Bedford-square, W.C.1.

War Memorial in Kennington Park.

This memorial is to be erected on a site in Kennington Park, and is in memory of the Fallen of the 24th Battalion London Regiment, "The Queens." The memorial is built of Portland stone and has at its base a group of trophies in bronze and a bronze band running round.

The contractors for the monument are Messrs. Harvey Bros., of 97, Wyndham-road, Camberwell, S.E. The bronze trophies and band are being supplied by the Crittall-Freeman Bronze, Ltd. The sculptor is Mr. L. F. Roslyn, and the architects Messrs. Lanchester, Lucas & Lodge.

"Burnt Stub," Chessington, Surrey.

These illustrations, with the exception of the barn, show an addition made to this house since the war.

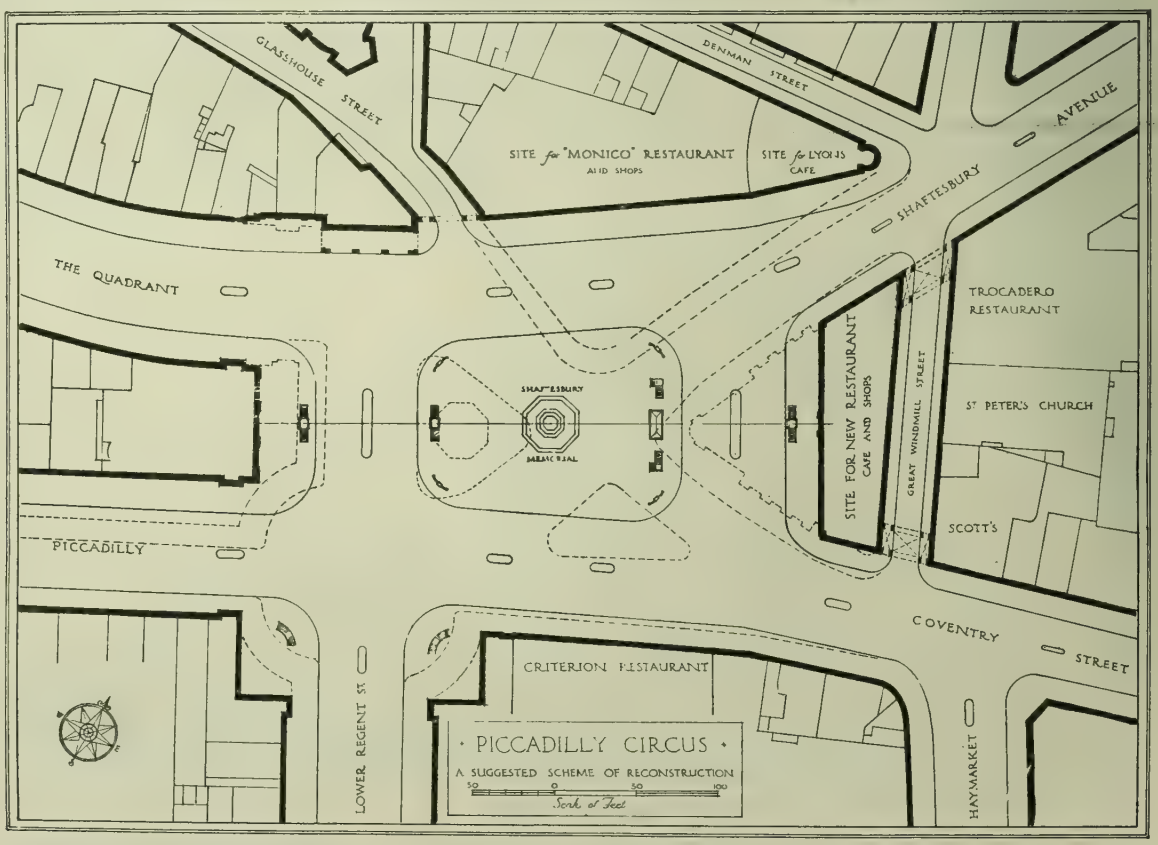
The barn, which stood only a few feet from the original house, which was long ago a small farmhouse, was connected to the house by means of a passage and a few steps, and was found to be in such good preservation that it was only necessary to strip the roof and relay the tiles and to replace one or two portions of the roof principals which had decayed, to form an admirable billiard room with oak panelled walls and oak floor. The fireplaces shown were, of course, additions to the original fabric, as were the lavatories adjoining. The end wall was pierced with French windows, giving access to a large covered loggia.

The house was originally a quite interesting farmhouse, but later additions were made of a suburban villa type, but which were removed when the late Sir Francis Barker purchased the estate. It was then decided to add to the house very largely and to cover the small existing portion of the building with brickwork to match that of the new addition. Small hand-made bricks of beautiful texture and varying colour were supplied for this purpose by Messrs. Ames & Finnis; the stonework to the windows, porch and battlemented parapet is of Ham Hill stone. The roof was covered with hand-made sand-faced tiles, of dark varied colours, also supplied by Messrs. Ames & Finnis.

The photographs of the entrance porch show the simple treatment of stone and brickwork. Inside the porch is an oak door, the wrought-iron latch and bell pull being designed and made by Mr. Frost. The photograph of the entrance hall shows the walls panelled to the ceiling with oak panelling supplied by Messrs. T. Crowther & Son, with an old Dutch chimney piece purchased by the owner. The dining room was based on details of Haddon Hall, the oak panelling supplied by Mr. Eshelby following exactly the detail of Haddon Hall panelling, as also did the plaster ceiling which Mr. Eshelby also supplied. The remainder of the house on the ground floor included drawing-room, morning-room, library, extensive tiled kitchens, sculleries, pantries, &c.

On the first floor are the bedrooms, dressing rooms, Lady Barker's boudoir and several bathrooms fitted with sanitary goods supplied by Messrs. John Bolding & Sons.

The general contractors for the whole of the work were Messrs. F. & H. F. Higgs, Ltd.



The architect is Mr. Leonard Martin, F.R.I.B.A.

The Squaring of Piccadilly-circus.

This scheme is by Messrs. W. Harding Thompson & P. D. Hepworth. The plan and view illustrated are self-explanatory.

Union Bank of Manchester, Blackpool.

This bank, about to be reconstructed, is situated in Birley-street. The lower story will be entirely of red granite, and the upper stories, which will be let off as offices, will be of Yorkshire stone. The whole of the internal fittings will be of oak; the public space will be covered with marble slabs, and the staff portion of wood blocks. The architect is Mr. Herbert Wade, of 2, Birley-street, Blackpool.

Design for a Fashions Fair. By MR. CECIL MASEY. (*See p.* 260.)

DESIGN FOR A FASHIONS FAIR.

THE design for a Fashions Fair, illustrated in this issue, has been prepared on lines incorporating architectural principles. The existing buildings are mere skeletons, and therefore the main central and side avenues have been formed as a colonnade with fibrous-plaster columns with complete entablature over. Above this a draped pendant roof would be formed in colour to conceal the roof trusses, and the central rotunda would be made a special feature with effects devised by means of a colour scheme and terminating in the centre with massive electroliers. Apart from this, lighting would be adopted by means of high power lamps above the drapery.

To relieve the monotony of a long uninteresting main avenue, a large central rotunda has been arranged, together with smaller rotundas at each end which would give vistas in all directions, and, in addition to giving direct emergency access, would make easy access to fire arrangements, in addition to which every exhibitor would have fire extincteurs in his stand. Seats would be arranged in the centre of the rotundas forming a rest space for visitors.

The main avenues would be connected at the extreme ends by corridors, which also give access to a dress salon in which mannequins would parade. A special stage gallery and staircase would be built for this purpose, and a distinctive feature would be made of novel lighting arrangements.

Club premises would be constructed for the use of exhibitors' staffs, where there would be a private restaurant, rest room and lounges.

R.I.B.A.

The attention of the Council of the R.I.B.A. has been directed to the action of certain members who were unsuccessful in a recent competition, in addressing letters to the Press impugning the award of the assessor. It is the opinion of the Council that unsuccessful competitors, if they feel that they have grounds for dissatisfaction with an assessor's award, should approach the R.I.B.A., and that the ventilation of grievances in the public Press without such reference to the R.I.B.A. is highly undesirable. It is to be understood that this expression of opinion by the Council is not intended to preclude genuine and disinterested artistic criticism of designs submitted in competition.

MEETINGS.

SATURDAY, *February* 16.

Architects' and Surveyors' Assistants' Professional Union.—Visit to Britannia House, Finsbury-circus, E.C. At the entrance, 1.45 p.m.

MONDAY, *February* 18.

Royal Institute of British Architects.—Mr. Paul Waterhouse, P.P.R.I.B.A., on "The Charing Cross Bridge." At Burlington House, Piccadilly, W.1. 8 p.m.

TUESDAY, *February* 19.

Design for a Fashions Fair. By MR. CECIL MASEY.

THE LONDON SOCIETY.

SLUM AREAS IN LONDON.

ON February 8 Lieut.-Col. Cecil B. Levita, C.B.E., M.V.O., J.P., Chairman L.C.C. Housing Committee, lectured before the London Society on this subject. The Rt. Hon. Neville Chamberlain, M.P., presided.

The Right Hon. Neville Chamberlain, M.P., in introducing the lecturer, said the subject of slum areas in London was by common agreement most urgent, and perhaps the most difficult, of all social problems. There was some comfort in the fact that they were not responsible for the cause of the problem, a legacy that came from their forefathers, the result of an industrial revolution about the eighteenth century. Before that the whole face of the country was different from the present day. The bulk of the people lived in the country, and though communications were extremely difficult they were not less happy than the people of to-day. The introduction of machinery, etc., and the introduction of the factory system meant changes in the habits and lives of the people as a whole. They got drawn into the cities, so to-day they found in every big industrial centre, above all, in London, vast accumulations of insanitary dwellings, which were responsible for high mortality and moral destruction.

Speakers on the slums often devoted nine-tenths of their words to the horrors and one-tenth to improvements. There was no easier way to disguise insufficiency of constructive ideas than by telling people what they already knew.

The creation and growth of slums had been a slow and gradual process; an accumulative process going on for 100 years. Those who imagined that by some heaven-sent remedy, or heaven-sent minister, they were going, in the twinkling of an eye, to clear the slums, were preparing for disappointment. It was not merely a question of pulling down and putting up so many houses. Take London, the most difficult of all cities. In nineteen wards they had an average of 53 houses to the acre and about 450 persons. That meant that the problem of the slum areas was not merely replacing one set of houses by another. It was a problem of the redistribution of a large part of the population. But they could not begin redistribution until they had somewhere for the population to go. They must have available housing accommodation. It would take time to produce sufficient surplus to bring them back even to 1910. In 1910 the shortage of labour was the chief difficulty, and he wished the Government every success in their efforts to increase building labour. They could not, in any case, get 250,000 houses a year for some time to come.

Town Planning had advanced by great strides during the last ten years. More and more town planners saw, when dealing with the surroundings of a great city, that it was hopeless unless they could deal with that part of the city which had already been built up. Not a town plan for one or two isolated parts, but for the whole city.

Lieut.-Col. Levita, having outlined the antiquity of the housing problem, said he was not actuated by any desire to extenuate the existing state of affairs, but rather to show the disastrous heritage of bad conditions, common to many ancient cities, bequeathed to the present generation. Those who know their London must admit that, although much remained to be done, a vast, though often unrecorded and forgotten, amelioration of its condition had slowly but surely accrued during the later period of its history.

The problem was much aggravated by the abnormal lack of housing accommodation. It must be remembered that in the statistics, both of accommodation and overcrowding, which were derived from the census of 1921, the acute shortage of housing had at the time of the census only existed for about three years. Conditions of high cost of living and shortage of housing which combined to drive people to overcrowding and slums, had existed for a long period. Consequently it was not feasible to execute any scheme of slum reconstruction until new accommodation had been built, in extent at least sufficient for rehousing adequately the same number of persons as were to be displaced.

A surplus of good working-class accommodation was the best automatic cure for overpopulated slums. Nevertheless, this desirable consummation in itself would not solve entirely the problem, for there were many insanitary areas which must absolutely be removed from the face of London.

Bad tenants could, and in fact frequently did, actually induce slum conditions, and when effectuating a reconstruction scheme they generally found a residue of such people that baffled efforts at rehousing.

The L.C.C. had in hand the reconstruction of seven insanitary areas representing:—

Persons displaced, 16,500; persons to be provided for, 14,500; area in acres, 55; estimated nett cost, £1,000,000. There were also a number of small schemes in hand or under consideration by borough councils.

At the present moment the Housing Committee was engaged in preparing a further number of schemes, as he was enabled to make an agreement, on behalf of the Council, with the late Government, whereby the latter had allocated to London an annual sum of not less than £50,000 out of a sum of £200,000 a year earmarked to meet losses arising yearly from slum clearance schemes undertaken in England and Wales. Unfortunately, it was estimated that there were nearly 1,000 areas, containing something like 11,500 houses, or approximately 100,000 persons over and above schemes already commenced, to be dealt with.

Many of these areas, by reason of their size or situation, were difficult to deal with satisfactorily by a scheme involving reconstruction of the site. These must be razed to the ground and the inhabitants entirely provided for elsewhere. "Zoning," namely, the allocation of the use of the land to its most suitable and economic purpose, always presented difficulties, and these were great in London.

In connection with the cost of building, it might be stated that all items were roundly made up of labour 45 per cent., materials 50 per cent., and profit 5 per cent. If they examined further, seeing that a considerable part of the cost of all materials was due to labour, it would be found that between 80 and 90 per cent. of the total costs of a building might be ascribed to labour. The shortage of skilled labour in the building trade seriously hampered everywhere the provision of new housing accommodation. This shortage, and, unfortunately, an increasing shortage, had been known to exist since the termination of the war; and it was regrettable that steps had not been taken by those concerned to overcome it. The building industry to-day was probably at least 25 per cent. weaker than in pre-war days, and it was not very encouraging to note that the numerical strength of the operatives engaged in this great industry had decreased by 50,000 in the last twelve months.

With regard to new legislation, it was suggested that instead of proceeding to acquisition, clearance, and rehousing when an area had been declared, after public inquiry, to be an insanitary area, the local authority should be empowered to suspend all action for such a period as, having regard to all the facts, seemed fit.

SHOWING OUTER WALLS RAISED.

The Queen's Dolls' House. SIR EDWIN L. LUTYENS, R.A., Architect.

ARCHITECTURAL PRIZES AND STUDENTSHIPS.

In our issue for February 8 we gave the annual address of Mr. J. Alfred Gotch, President of the Royal Institute of British Architects, to architectural students. We have pleasure in now giving extracts from the criticism given by Mr. Henry M. Fletcher on the same night.

In the course of his remarks Mr. Fletcher said criticism had been described as "the adventures of a soul among masterpieces," and although the achievement of masterpieces might hardly be expected among students' designs, save once or twice perhaps in a half-century, who could tell that this might not prove itself one of the golden years? It would be unfair, as well as foolishly rash, to say that none of those whose work they saw that night had it in him to achieve a masterpiece one day. There had been great men of all kinds, late developing, whose early attempts bore little promise of their maturer fulfilment, and among architects there were those whose genius, like a fowl's gizzard, needed something grittier than an imaginary programme to stir it into effective working. And there was this to be said for this year's competitors, that they had competed. Two of them, it was true, in the Owen Jones studentship and the Grissell Medal, competed against nobody, but that was not their fault—they put their fortunes to the test.

No, it was not a golden year, and the task of criticism offered few delights. Six entries for the Soane Medallion, the most famous and fame-bestowing architectural prize in the kingdom, with a subject to tempt the most soaring imagination. In this case, he was happy to say, the competition, though among so few, had been of a quality to admit the awarding of the medallion.

Four for the Pugin Studentship, but no award. Three for the Essay Medal, no award. One for the Owen Jones Studentship, which was awarded. One for the Grissell Medal, no award. For the Arthur Cates Prize, no entries.

It was a melancholy list, and needed careful consideration by the Institute, the Schools of Architecture, and all who were interested in architectural education, whether as administrators, masters, or learners. Mr. Fletcher, after discussing in detail the various works, said it was clear from the unsatisfactory state of the competitions that something was wrong somewhere, and he took it that the duty of a critic was not only to comment on the individual work submitted, but also, and perhaps even more urgently, if the occasion called for it, to discuss the conditions under which the prizes were competed for and awarded.

What, then, were the causes of this apparent lack of interest? Was the whole rising generation of architects wanting in ambition? If so, as Alexander Selkirk said of the beasts in his solitude:

"Their tameness is shocking to me."

But he did not for a moment believe it. On the contrary, he believed, and all his experience as a member of the Board of Education confirmed the belief, that there was a great, even an unusual, vitality and enthusiasm for architecture in the present generation of students. They must look further afield, and drop, if they were inclined to take it up, the notion so comforting to the middle-aged, that the younger men did not work as hard, or as keenly, as they themselves did, for it would not fit the facts.

The main cause appeared to be the immense change which had come over the whole system of architectural education in this country since the last century: these prizes and studentships were founded to suit the old system of scholarships. The school courses, which in the principal schools extended to five years, were so absorbing that they left no time for the prolonged extra work called for by such competitions as the Soane and the Tite. It was difficult to see, though it should be inquired into, whether these competitions could be in any way incorporated into the work of the schools with fairness to students who were outside the schools, and without destroying the spirit of individual initiative which it was the intention of the founders to foster. It was true that they were open to competitors long after the school age—indeed, up to 30, 35, and 40—but it must be remembered that architectural education nowadays entailed a rather prolonged claim upon the resources of parents, and it could not be called money-grubbing if students felt it their duty, in return for this, to set about earning their own living with as little delay as possible. It might be, too, that some of the studentships were hampered with conditions which made them less attractive now than in former times and in different circumstances. Possibly there was a fashion—they were all subject to changes of fashion—for standing aside from Institute competitions. If so, it was time the fashion was changed again, and a more intelligent fashion set up in its place. Or, again, the whole thing might be one of the obscure consequences of the war, which would tend to correct itself if and when the world came right-side up.

The position was difficult, and had to be faced. It would be a calamity if prizes, which in the past had been contended for by the most distinguished throughout many generations of English architects, were to fall into disuse. He had endeavoured to point out some of the reasons for the present slump, to diagnose the symptoms of the disease, but the prescription of the remedy called for the careful investigation of many facts, and the collaboration of all those, or representatives of all those, who cared about architectural education. The Board of Architectural Education had appointed a committee capable, by its constitution, of looking at the matter from every point of view. It would be their job to look at it very hard, and to consider whether the difficulty was temporary or permanent, whether or no alterations should be made in the schools or the prizes, or both, in order to bring students and prizes nearer together; what accretions time had stuck on the original intentions or constitutions of these prizes; and what alterations, if alterations were desirable, could be made in the trusts or deeds of foundation, remembering that the prime intention of the founders was that these prizes should be awarded in perpetuity, and that any condition which hindered this prime intention, even if expressed in the most legal of legal phrases, was an encumbrance to be got rid of to the utmost that the law allowed. They looked to them to restore the ancient lustre to these historical contests.

Main Entrance.

"Burnt Stub," Chessington. Mr. Leonard Martin, F.R.I.B.A., Architect.

QUEEN'S DOLLS' HOUSE.

In this issue we give some illustrations of the Dolls' House, designed by Sir Edwin Lutyens, R.A., to be presented to Queen Mary by those who have helped in its production as artists, craftsmen, or donors, the list of whom includes the following :—

Hall and Staircase.

Artists or Craftsmen.—Balustrade : Mr. and Mrs. J. Starkie Gardner. Lifts : Messrs. Waygood-Otis, Ltd. Lanterns : Mr. and Mrs. J. Starkie Gardner.

The Library.

Artists or Craftsmen.—Walnut panelling, shelves, &c. : Messrs. J. Parnell & Son. Ceiling : Mr. William Walcot. Fireplace : Messrs. H. T. Jenkins & Son, Ltd. Sculpture : Mr. V. Martorell.

Dining Room.

Artists or Craftsmen.—Ceiling and overdoors : Prof. Gerald Moira. Limewood carvings : Messrs. W. Turner Lord & Co. Fireplace : Messrs. H. T. Jenkins & Son, Ltd.

The Saloon.

Artists or Craftsmen.—Ceiling : Mr. Charles Sims, R.A.

King's Bedroom.

Artists or Craftsmen.—Fireplace : Messrs. H. T. Jenkins & Son, Ltd.

King's Bathroom.

Artists or Craftsmen.—Mother-of-pearl electric fittings : Messrs. Noble & Co. Sanitary fittings : Messrs. John Bolding & Sons, Ltd.

King's Wardrobe.

Artists or Craftsmen.—Ceiling : Mr. W. G. de Glehn.

Queen's Bedroom.

Artists or Craftsmen.—Ceiling : Mr. Glyn Philpot.

Queen's Bathroom.

Artists or Craftsmen.—Ceiling : Mr. M. Greiffenhagen. Floor, mother-of-pearl : Mr. W. W. Mitchell. Sanitary fittings and plumbing : Messrs. J. Bolding & Sons, Ltd. Bath, alabaster : Messrs. H. T. Jenkins & Son, Ltd.

Queen's Wardrobe.

Artists or Craftsmen.—Ceiling : Prof. R. Anning Bell.

Day Nursery.

Artists or Craftsmen.—Wall decoration : Mr. Edmund Dulac.

Queen's Sitting Room.

Artists or Craftsmen.—Wall decoration : Messrs. Wm. Clouds, Mr. Glowson.

Exterior.

Artists or Craftsmen.—Lifting apparatus : Messrs. Redpath, Brown & Co., Ltd. Lead figures : Sir George Frampton. Lead vases : Messrs. T. Elsley, Ltd. Carving : Mr. Eric Broadbent. Roof slates : Messrs. Stirling & Johnson, Ltd. Painting exterior : Messrs. Muntzer & Son.

The entire structure was made by Messrs. J. Parnell & Son, at Rugby.

Messrs. Higgins & Griffiths carried out the electrical installation.

Messrs. Muntzer & Son painted the house externally and internally.

The marble work was all executed at Torquay by Messrs. H. T. Jenkins; the marbles used came largely from India.

All the wood carving both external and internal (except in the dining room) was done by Mr. Eric Broadbent.

All the grates, fender and fire-irons, locks, bolts, handles, are the work of Messrs. T. Elsley, Ltd.

Jerusalem Public Works.

The Director of Public Works, Russian Buildings, Jerusalem, desires to receive regularly from manufacturers catalogues, price lists and other advertising literature, concerning all kinds of plant, tools, instruments, and materials requisite for general public works, including road building, water and electricity supply, building construction, drainage, &c

ART STUDENTS' PAINTINGS.

In the course of a recent joint letter to *The Times* Messrs. Walter Bayes, William Rothenstein, Charles Sims and Henry Tonks stated, in view of the discussion aroused by the rejection of the paintings prepared by London art students for the approval of the London County Council, they thought it desirable to state the facts of the case as they appeared to them.

When the new County Hall was nearing completion, Mr. Charles Sims and Mr. Ralph Knott, the architect of the building, who were both interested in the revival of mural decoration, suggested that four of the principal schools of art should submit designs for decorating panels in one of the Council chambers. Mr. Knott, while unable to guarantee the unqualified acceptance by the Council of the designs, was able to assure them that the proposal had their sympathy. Subject to their approval of the designs the Council would pay £50 to each of the four schools concerned for working expenses. The proposal was willingly accepted. Feeling that the official rooms should be reserved for decoration by tried artists, they preferred to confine the experiment to a small part of one of the many corridors intersecting the vast building. The eight principal lunettes were subsequently fixed in the corridor and were accepted at a meeting of the Establishment Committee of the L.C.C., at which Mr. Sims was present. The students were duly informed.

After some weeks they heard that the committee had rescinded this, their resolution. They accordingly addressed a letter to the chairman, expressing their dismay at this unexpected issue to a hopeful experiment.

In the course of a letter to *The Times* of February 11, Mr. Andrew T. Taylor stated the challenge to the L.C.C. could not be ignored.

He was entirely in favour of appropriate mural decorations for the County Hall, at the proper time. A noble public building should be a harmonious symphony of architecture, sculpture, and painting; if one of the three was wanting it was incomplete, but they must be harmonious in their style, concept, and treatment, which was not the case with the designs under discussion.

In the Hotel de Ville in Paris they did not find that its splendid chambers and salons were decorated by young students from the art schools, but that artists such as Puvis de Chavannes and others had been commissioned; and all over the Continent, and especially in Italy, the town halls and public buildings were glorious with the genius of their greatest painters. He should gladly hail the advent of the personal work in their County Hall of any or all of the four artists who signed the manifesto.

They owed a duty to their great artists, who had by patient study, long experience, and outstanding ability risen to the top of their profession, that they should not be passed over in favour of immaturity. There were many schools and halls in the poorer parts of London that would welcome the work of their students in art schools, with a twofold advantage—drab neighbourhoods would be brightened, and students themselves would gain experience in the execution of mural painting in actual buildings.

In the course of an interview Mr. Halsey Ricardo said without actuality the art of mural decoration could not progress. Merely imaginary work was not of the slightest use. He felt very strongly that young students should be encouraged to experiment, not only in the schools and studios of artists, but on the actual walls themselves. How else, taking into account the lessons of history, could the art of mural decoration progress? After all, the experiment—at an extremely inexpensive rate—was only in a small part of one of the corridors.

Schools of art were supported by the State, and, presumably, the ratepayers' money. If their work were not considered good enough after having been once accepted, people would naturally say, "What is the good of them? Scrap the lot."

WAR GRAVES IN FRANCE AND BELGIUM.

The fourth annual report of the Imperial War Graves Commission states that, outside the United Kingdom (excluding the Dominions), work has been begun in 1,045 cemeteries, communal cemeteries, churchyards, and burial grounds, and in the case of 725 the constructional work has been completed. Of these last 557 are situated in France and Belgium, 80 in Italy, 21 in Gallipoli, 24 in Sweden, 14 in Egypt, 10 in Macedonia, 10 in the Balkans, four in Palestine, and one each in Kenya, Gibraltar, Persia, Finland, and Switzerland. The remaining 320 are still under construction. and of these 287 are in France and Belgium, four in Italy, 15 in Gallipoli, five in Palestine, one in Egypt, four in Holland, and four in Kenya. The number of headstones which have been shipped to theatres of war is : To France and Belgium, 174,552; to Macedonia, 8,489; to Egypt, Palestine and Gallipoli, 11,000; and to Italy and elsewhere, 7,734—exclusive of headstones erected in the self-governing Dominions. In the United Kingdom contracts have been placed for constructional work in 83 military plots in cemeteries, of which 62 have been completed. Headstones have been erected in 43 of these, and in addition 1,547 headstones have been erected in 600 other churchyards.

The memorials to the missing in Italy and Macedonia have been completed, and nine more are under construction, of which three are in the United Kingdom, two in France, three in Gallipoli, and one in Egypt.

The Commission have provisionally decided on the following places for the erection of memorials to those who fell in France and Flanders, but have no known graves : Nieuport, Ypres, Armentières, Bethune, Arras, Pozières, Amiens, St. Quentin, Cambrai, La Ferté sous Jouarre, and Soissons; and one near Neuve Chapelle, to commemorate the missing of the Indian Army. The sites for the memorials are under consideration, as also is the method of calling for designs, and the President of the Royal Institute of British Architects has consented to advise on the matter and to appoint assessors.

It has been decided to erect in a number of Cathedrals in France and Belgium, as a joint commemoration of the million or more officers and men of the whole Empire who fell during the war in all parts of the world. tablets similar in general form to that unveiled last summer in Amiens Cathedral by the Duke of Connaught.

The construction of the three naval memorials is proceeding satisfactorily. The one at Chatham will be completed by April; the Plymouth memorial should be ready by June; and the Portsmouth memorial will be ready about August. The three memorials are similar in design, each consisting of a column of Portland stone about 100 ft. in height, standing on a base with four buttresses surmounted by sculptured lions. At the top of the column are four bronze figures representing the four winds, above which is a copper sphere. Round the base of the column and on the buttresses are 32 bronze tablets, on which will appear the names of the missing. Above the name panels are four others, commemorative or symbolical, one on each side of the memorial.

Royal Academy Summer Exhibition.

The Summer Exhibition of the Royal Academy this year opens on May 5, and closes on August 9. The days for receiving works are as follows :—Water colours, pastels, miniatures, black-and-white drawings, engravings and architectural drawings, March 28; oil paintings, March 29 and March 31; sculpture, April 1. The hours for the reception of works are from 8 a.m. to 10 p.m. (except March 29, when the hours are from 8 a.m. to 2 p.m.). Not more than three works may be sent by any one artist. Labels and forms may be obtained, during the month of March only, from the Secretary, Burlington House, W.1.

APPROXIMATE ESTIMATES.

On February 11 Mr. Alan Paull read a paper on this subject before the Surveyors' Institution.

In the course of his remarks he said it would ease the life, and, incidentally, increase the earnings of quantity surveyors if bills of quantities were prepared for every building scheme, and remuneration received for such work. This, however, was Utopian, as human nature rebelled against paying for brainwork from which no benefit could be directly traceable; so they found the words "approximate estimates" had come to the fore.

If they traced the usual procedure in the matter of approximate estimates for building schemes they found the architect received from a client an outline of the sort of building he had in his mind, enumerated the amount of accommodation required, and then added as an afterthought that he was not prepared to spend more than so many pounds. The architect proceeded to prepare sketch plans, skeleton elevations, and perhaps a section, though more probably he contented himself with indicating on the elevation the floor levels. He then communicated with his quantity surveyor, and asked for an approximate estimate. It was here that experience of an architect's usual method of working out his schemes in detail was very essential and valuable.

How was the approximate estimate to be prepared?

It would, he suggested, be conceded that cubing was the most common of all methods. Cubing meant taking the outside size of the building, ascertaining the area occupied, and multiplying the result by a height taken from the top of the concrete in the foundations to half-way up the roof. It was advisable also to cube the chimney-stacks, bays, dormers, and other outstanding features, and include them in the total. A worrying point was often what depth of foundations to allow for, so it was essential to find out on what sort of site the building was to be erected, and the nature of the ground. Having obtained all the information possible under the above headings, came the crux of the whole problem, namely, the price per foot cube. It was only experience and comparison with the actual cost of similar class of work which could be a safe guide. To attempt to make a schedule as to the prices for various classes of building would, in his opinion, be absolutely misleading and valueless, as practically every job had to be viewed from its own angle. Not only had size to be considered, but position, whether the site was easy of access, whether the materials proposed to be used were easily obtainable in the locality, and the general character of the finishings. It might sound a heresy to many, but in his opinion success in deciding on the amount for approximate estimates depended largely on intuition, and no rule of thumb method could be laid down without becoming a trap for the beginner.

After deciding the price per foot cube for the building, in many cases the cost of central heating, electric wiring for lighting and heating, drainage, fencing, and paths had to be considered. In the first two cases it was advisable to pass on the approximate estimates to specialist firms, and in the remainder to take out the quantities roughly and price them at current rates. The cost of all these having been ascertained, the additional price per foot cube could be calculated and the report made out. Approximate estimates for buildings with deep basements presented a different problem. In these cases he was in favour of roughly taking out the excavation and brickwork, etc., up to ground level, as a guide to arriving at a price per foot cube, and treating in the same way any underpinning that might be required.

In the preparing of approximate estimates for alterations and additions to existing buildings it was advisable to visit the premises before attempting to place a value on the proposed works. The general method of construction and finishings must be noted, and it might be necessary to open up to ascertain the depth of foundations. Where distinct additions were proposed, these could be cubed in the ordinary way, and then any pulling down of walls or partitions, the erection of new partitions, etc., the blocking up of existing openings and cutting of new ones must be considered. It was also advisable to ascertain whether redecorations were to be included in the report.

Rough quantities was another method of preparing approximate estimates, but to his mind, except in the circumstances he had indicated, there was greater liability to error than in the accepted cubing. It was always a difficult matter to decide how much to take off and what to include in the descriptions. Pre-war it was generally accepted that in 1½ brickwork the finishings, both externally and internally of an opening, could be set against the deduction in the brickwork, and this still held good if the cost of ironmongery be added. Another drawback to this method was the time occupied in tabulating the various items, and where no payment could be anticipated for one's time and trouble this was a serious matter. In asking for an approximate estimate in a kind of off-hand way they were really making a demand for great skill and experience.

The issuing of certificates during the progress of the work might be said to come under the heading of approximate estimates. Where there were no bills of quantities these could be prepared only by carefully ascertaining the ratio the work done bore to the whole, and reporting in accordance therewith. Where bills of quantities priced in detail were available, it was then possible to come to a conclusion as to what proportion of each trade had been completed, not forgetting the preliminaries and provisional sums, until the work was approaching completion, when the total cost should be taken, and a deduction made for what had still to be done, and for the retention money under the contract.

One of the most difficult forms of approximate estimates was issuing certificates where work was being done under a priced schedule, and there also occurred a large amount of work as daywork. Further complications occurred where the client ordered work of a character not previously contemplated, and for which, therefore, there were no schedule prices. As was well understood, it was not always possible for measurements to be completed of any definite section, so that it could be billed and priced; so it was by no means easy to hold the balance fairly between the employer and the builder. In these circumstances he generally examined the method adopted by the builder for keeping his prime cost, and, if satisfied with it, he went through his figures as a help in arriving at an approximate estimate. In the early days of the lecturer's practice great stress was laid on the use of constants for labour in making approximate estimates.

The introduction of labour-saving machinery, first of all in stone working, not forgetting mouldings in joinery, and latterly in digging, concrete mixing, and breaking up of aggregate, had made it practically impossible to rely on any of the old tables. As far as his knowledge went no attempt had been made to form any tables meeting the new conditions of work, nor, he suggested, if any were formed, would they be of service after a very short period, considering the changes that were always taking place in the use of different materials and the varying speed of the human machine.

Thus far they had been considering approximate estimates from a surveyor's point of view, but to his mind even what they called a firm tender from a builder, when based only

The Sarawak Pavilion.

British Empire Exhibition. Messrs. J. W. Simpson & Maxwell Ayrton, FF.R.I.B.A., Architects.

on drawings and specification, was nothing more than an approximate estimate. He undertook to carry out certain work for a definite amount, which he considered would not only pay for all labour, materials, and overhead charges, but also leave him a good margin for living expenses. They all knew how often his anticipations came true, but who had not had the experience of being told of losses having been made? They might have a shrewd idea that losses meant that not as much profit had been made as anticipated, but, after all, they came back to the point that such tenders were, in fact, approximate estimates.

Very often, when an approximate estimate was being discussed, the question was asked, What is the relative cost of building work at the present time compared with pre-war? This did not admit of an easy reply, as in ordinary work methods of construction were adopted, and materials used, very different from the pre-war days; but speaking from his own experience, he was inclined to suggest the present-day cost was 1¾ times over pre-war.

There was one form of approximate estimate which, he understood, was used for insurance purposes, namely, by ascertaining the area of the rooms, or what was known as "carpet area," and attaching a price per 100 ft. super.

A quantity surveyor should first arrive, in the usual way, at the cost of the building before attaching any price to the floor area. He was aware that this floor area was often taken at a letting value for the purposes of a valuation of the property, but this was outside the scope of the present paper.

DEVELOPMENT OF LAND.

Mr. J. J. Done followed with a paper entitled "Approximate Estimates for the Development of Building Land."

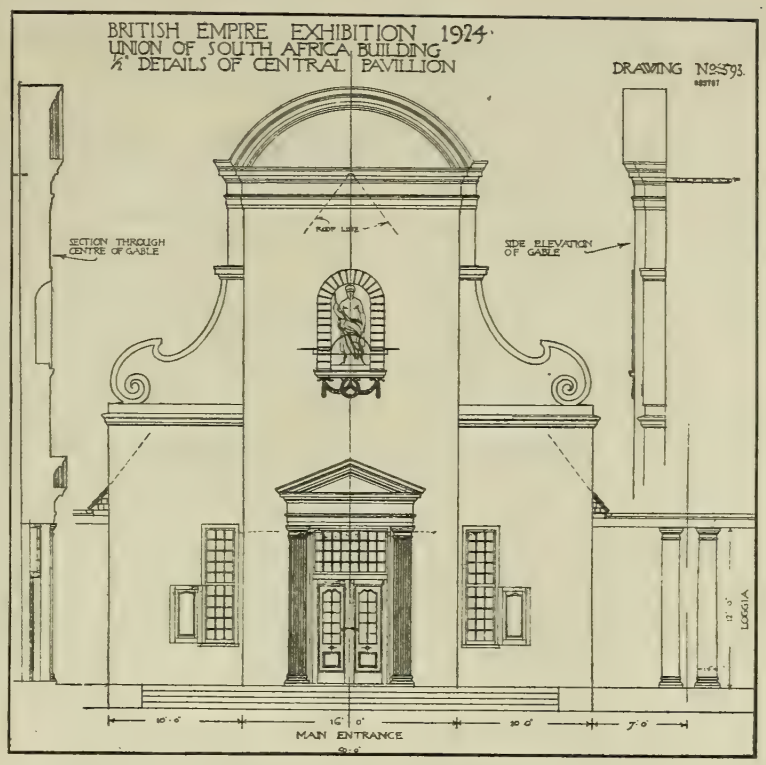
With matters in their present fluctuating state, he said, one could do so only with great diffidence, and rather with the desire to assist than with any feeling that the assistance might be of real value.

Before the war the all-round figure which he had in his mind was that the cost of developing building land could be reckoned at about £300 per acre. That was a figure which he had employed on many occasions, and which had generally justified itself; that was for plots having a depth of 100 to 125 ft. deep. Deeper plots required less road-making per acre, and therefore, some modification of that figure. At the present time the cost of development was not easy to reckon; but the following figures might be of some assistance.

In July, 1914, he obtained an estimate for a road 730 ft. long and 50 ft. wide, which came to £1,129. This included kerb, channelling and other works, forming a complete and fully-metalled road and paths, and requiring a sum of £55 for making a sewer connection under a tramway. In May, 1922, on the same bill of quantities, another estimate was obtained to see if it was practicable to go on with this road; and on this occasion the lowest estimate was £2,621 6s., that was nearly 2½ times as much. Since then he thought the cost of road-making had somewhat decreased, but for his own purposes he should be inclined, as a rough estimate, to take £750 per acre as against his former £300.

The following prices for a road at present under construction might furnish some guide:—

9-in. sewer, average 8 ft. 3 in. deep: 10s. per ft.;
Manholes: £5 per ft. of depth;
Storm-water drain, average 5 ft. deep, part 9-in., part 12-in., and part 15-in. pipes: 8s. per ft. run.
The pipes themselves cost as follows:—
343-ft. run of 9-in. pipe, 2s. 7d.
179-ft. run of 12-in. pipe, 5s. 1d.
291-ft. run of 15-in. pipe, 7s. 4d.
Inspection chambers, about 5 ft. deep, £20 each.
Gulleys, £12 each.



As regarded the cost of road-making, he had no figure for kerb and channel, as he did not think at the present time this was a justifiable expense in a builder's road; but the following figures for road-making might be of some assistance:—

Dig to top spit about 6 in. deep, and lay aside best turfs for re-use, at 3s. cube per yard.
Dig to clay and wheel and deposit (one run) spread and level for formation, including forming batters to cuttings and embankments, at 3s. cube per yard.
Dig to clay and remove and cart away or wheel, average 8 runs, at 3s. cube per yard.
Shoot clay or other approved spoil to fill up low places and to form embankment. Spread level and consolidate to formation level, including forming batters to embankment, at 1s. cube per yard.
Provide screened well-burnt clinker or other approved material, and well roll with a 10-ton roller to be 3 in. thick after consolidation, at 8d. per yard sup.
Provide good clean hard core, and well roll as before to 9 in. thick after consolidation, at 3s. 3d. sup. per yard.
Provide and spread gravel, or clean flints, to pass 2½-in. ring and roll as before to 3 in. thick after consolidation, and form proper cambers, at 3s. sup. per yard.
Lay turfs or top soil laid aside as before described to form cambers at side of metalled surface, and roll with hand roller to proper falls, at 4d. sup. per yard.

In addition to the foregoing figures 10 per cent. should be added for contingencies, including surveyor's charges for quantities, district council's fees, &c.

In making an estimate of the probable cost of development, in addition to the roads, the following items had to be taken into account:—(1) The redemption of land tax, if any; (2) the redemption of tithe-rent charge, if any. This was not absolutely necessary, but it was very desirable in the majority of cases. It was his custom on one estate not to redeem the tithe, because landlords continued to pay as before, which saved trouble. (3) Compensation to tenants on obtaining possession. (4) The cost of diversion of footpaths, his first experience of which was an account for £40, and his most recent, £70, for the same thing. (5) The loss of interest during the process of development; surveyor's commission for the introduction of builders; legal expenses, &c. As to these, one could offer no reasonably reliable guide, because if the estate went off rapidly it was one thing, but if it hung fire it was another and very different thing.

[A report of the discussion on these papers will be given in our next issue.]

British Empire Exhibition.

MESSRS. J. W. SIMPSON & MAXWELL AYRTON, FF.R.I.B.A., Architects.

Kelly's Directory.

WHAT a different place London would be if it had been arranged as systematically as its Directory, and if its development had been as carefully attended to! This year's *Kelly's Directory*, just published (London: Kelly's Directories, Ltd., 186, Strand, W.C.2; price 55s.), has been brought up to date with the thoroughness and carefulness characteristic of this volume. The number of corrections made in this edition exceeds 350,000, principally caused by changes during the past twelve months in residential and business addresses and professional and trade descriptions; alterations necessitated by postal and telephone regulations, and the developments in the social, political, municipal, official, legal, financial or banking activities in the Administrative County of London. Within this comprehensive edition of some 4,000 pages will be found the names and addresses of the inhabitants of London, classified (1) according to streets, and (2) in alphabetical lists of the private residents and of those engaged in professions, commerce or trade. The Classified Trades Section gives an alphabetical list of London's professions and trades (over 5,000), each with a list of those engaged therein. A closer analysis of trade headings than has hitherto been attempted is given. Particulars of the establishments of the various Government departments with alphabetical lists of officials; the seating plans of the leading London theatres; and a transport and hotel section of all principal places throughout the country, giving hotels, railway stations, early closing and market days, &c., are included in this edition of a work indispensable to anyone whose business requires a compendium of information on London.

THE ARCHITECTS' AND BUILDERS' INQUIRY BUREAU.

Estimating.

SIR,—In a book on estimating, published before the war, the proportion which the cost of the work in each trade bore to the total cost of an average brick and slate building was given as: Bricklayer 33 1-3 per cent.; carpenter and joiner, 30 per cent.; plumber, 6 per cent.; decorator, 5 per cent., and the remainder was about equally apportioned between the other trades employed. Since the war some materials have altered in price much more than others (though the increase in cost of labour has been about the same in all trades). I should be exceedingly interested, therefore, to know (i) how the above-mentioned figures have been modified, and (ii) what is the average proportion of total cost attributable to "labour" and "materials" respectively, at the present time, in the case of (*a*) a brick and slate dwelling-house, (*b*) a steel-frame and stone shop and office block. The writer would also be greatly interested in the opinions and experiences of practical men as to which of the various forms of fireproof partition (breeze slabs, plaster slabs, &c.) they find the most economical and efficient.

"D. B. K."

[REPLY.]

It is somewhat difficult to allocate the proportional cost of the various trades in building operations owing to the varying factors forming the basis of calculation. We, therefore, give examples of three different types of buildings, all built about the same time and in the same district:—

(*a*) A 28-bed hospital, mostly a one-story building, faced with 2-in. red bricks.

(*b*) A mission hall faced with red bricks.

(*c*) Eleven houses under a housing scheme, 3-bedroom and parlour type, faced with white bricks.

The percentages work out as follows:

	(*a*)	(*b*)	(*c*)
Preliminary	1.75	1.00	1.00
Excavator and concretor	10.50	9.00	4.80
Drains	3.20	2.55	3.20
Bricklayer	23.30	30.10	25.00
Mason	3.05	2.00	5.40
Tiler	3.10	5.40	5.50
Carpenter and joiner..	25.00	23.00	22.80
Smith and founder, including heating and lighting	8.40	12.00	6.60
Plasterer	6.20	3.10	9.20
Plumber	9.75	7.10	11.00
Glazier	0.60	0.55	1.00
Painter	5.15	4.20	4.40
	100.00	100.00	100.00

With regard to the steel-frame building mentioned by our correspondent the variation is so great that no general proportion can be calculated that would be of any service.

Many attempts have been made at various times to allocate the proportion of labour to material in the various trades, but none hitherto has stood any general test.

Breeze concrete pre-cast slabs of good quality have generally proved the cheapest and most reliable of the various forms of partitions. Of the various patent forms, it depends largely upon the special circumstances of their use.

Price for Pointing.

SIR,—I should be greatly obliged if you will kindly inform me as to what is a fair price per square yard for "pointing"; owner of property finds material (one cement, one sand). Property is 60 years old; bricks badly weathered; arrises rounded. All rotten mortar is to be raked out, and this varies from ½ in. to 2 in. deep. Decayed bricks (of which there averages three per square yard) to be filled in with bricks cut to fit. Owner offers me 1s. per square yard. I am unemployed but do not think this a reasonable figure. I trust I am in order in making this request.

Birmingham. "J. L. S."

[REPLY.]

On the particulars given above the value of the labour would be from 2s. 3d. to 2s. 6d. per yard.

Heating and Hot-Water Supplies.

SIR,—I do not see why "Labour-Saver" should be afraid of furring his heating installation, unless he is going to use small tubing to feed his radiators. I would not advise him to take his hot-water supplies direct from his heating installation, as he will always be troubled with rusty water at the taps. The most practical and satisfactory way is to take two circulating pipes to a copper cylinder and take the hot-water supplies from the cylinder. The cold water feed cistern will do for the heating and hot-water supplies. He could also work a back boiler from the kitchen range in conjunction with the heating boiler. There is no successful way of treating tubing with any permanency. I should only be too pleased to draw him a scheme if he would only let me have a plan of the bungalow.

Manchester. WM. COWLISHAW.

Treatment of Oak.

SIR,—I have seen external oak of a very beautiful silver-grey effect, which, I am informed, has been treated by the application of quicklime (applied like whitewash in a thick paste), left on for 24 hours or longer and then brushed and washed off. My informant, being absolutely reliable, I should have no hesitation in recommending this method to your correspondents. "READER."

SIR,—In reply to "Architect," to obtain the silver-grey effect on oak used externally, do nothing; the weather will do all that is required.

J. A. HALLAM.

Smuts from Chimneys.

SIR,—The chimney designed on apparently ideal lines and yet badly behaved, presents a very interesting problem. The first words that rise to the tongue are "bad coal," but "Architect" takes them out of one's mouth and one has to look elsewhere.

It seems to me that the chimney draws too well and combustion is too rapid, producing much the effect of a railway engine when put to its utmost capacity and belching forth smoke and cinders.

If "Architect" has observed his fires to roar away very quickly and the flues to yield very little soot when cleaned, this would tend to confirm my diagnosis of the case.

The remedy would then be to check the draught by substituting an "Edwardian" pot for the present one. This type is closed at the top with lateral outlets, and though designed mainly to check down draughts, would, I think, have the desired effect in this case.

In any case it would not be a very extravagant experiment to try. "ANOTHER ARCHITECT."

A Slating Problem.

SIR,—I am of opinion that the oil putty method suggested by your correspondent "Mancunian" is unnecessary and would prove extravagant. Workmen are trained to do their job in a certain way, and extraordinary methods lower their output and lead to heavy quotations, certainly in this case much above the suggested 6d. per yard.

Given a good tilt and, for preference, a good sprocket, to produce an appreciable hollow to the roof surface, slates will lay quite flat enough for all practical purposes. Rattling slates are generally a sign of bad workmanship. They need to be well centre-nailed, the nails being well driven home up to the limit of the strength of the slate. A good slater knows just how far this is by intuition.

I fully concur with "Mancunian's" objections to bedding the slates in mortar. It seems to me quite a moot point if the post-war economy of omitting torching is not a blessing in disguise, if accompanied with no corresponding economy in lap. "NOTTINGHAM."

Embossed Mouldings.

We have received an inquiry from "G. D. A." for a machine to make embossed picture frame mouldings in wood.

Builder's Remuneration.

SIR,—Is a builder who prepares his own plans and submits them to the local authority entitled to charge a customer for the service as a separate item, in the absence of any understanding, and, if so, what is a fair remuneration? It is assumed the service is efficient and that the work is carried out by the builder himself.

ERNEST EDWARD SMITH.

[REPLY.]

Under Section 157 of the Public Health Act, 1875, an urban authority is empowered to make (and usually does make) by-laws for the deposit of plans by persons intending to construct buildings. It is, therefore, a duty on the part of the builder (or an architect where functioning), and a condition precedent to building, that plans must first be submitted to the local authority for approval. No precedent can be quoted, but it would appear that where a builder contracts to build and complete a building, according to plans prepared by him, or agrees to sell a building built by him to a "customer," he is not entitled, in view of the above condition, to make an additional charge for submitting plans to the local authority, unless the right to do so has been reserved. Where the right is reserved, or where (as in the case of an architect functioning) it is customary to make an additional charge for plans submitted to the local authority, it depends on the magnitude of the work. The charge may be anything from, say, £1 1s. for a villa to £5 5s. for a mansion or similar buildings.

Ancient Lights.

SIR,—What precautions are necessary before taking down old premises with lights now overlooking the next premises with a view to preserve the lights as now existing in the new erection? Is it neccssary to afix notices, "Ancient Lights" on the building some time before commencing the taking down? The area of the present lights will not be increased in the new building. "M. S. A."

[REPLY.]

Anyone, we believe, may pull down a building, including its windows or similar apertures, by which his right to an easement has been enjoyed, without abandoning his right. Nor is it necessary that, pending rebuilding, any part of the wall containing the windows should remain standing, or that rebuilding must commence immediately after demolition of the premises. The length of time between demolition and rebuilding would, however, weigh in the decision as to whether there had been an intention to abandon. To avoid difficulties, exact plans and measurements should be made, and photographs taken of the walls and lights therein, before demolition; for if in the new building the lights (as to position and area) are not altered an action can be supported against any increased obstruction by the adjoining owner. There is no real necessity to put up any notice, though it would be of advantage to do so if it is not intended to rebuild immediately or within a reasonable time. Further, it may be prudent to submit the plans and measurements above referred to, together with the plans of the proposed new building, to the adjoining owner, before commencing to rebuild.

[Will Mr. R. Stannard let us have his address?]

[Other letters are unavoidably held over.—ED.]

NATIONAL HOUSING POLICY.

MEMORANDUM BY THE ROYAL INSTITUTE OF BRITISH ARCHITECTS.

The Royal Institute of British Architects was founded in the year 1834, and incorporated by Royal Charter in 1837. In addition to its own members and licentiates it represents the members of architectural societies which are established in every part of Great Britain and are allied to it. The Royal Institute thus represents about ten thousand members of the architectural profession.

Early in the 'fifties of the last century the Council of the Royal Institute issued an appeal to improve the dwellings of the poor. Since that date some thirty or more Housing Acts and Acts bearing on the housing of the working classes have been passed. These have been in the main based upon considerations of health leading to the examination of the construction of such houses, the size of their rooms, their lay-out, and their number to the acre.

Standard.

In later years considerations of decency in regard to the separation of the sexes have largely determined the minimum number of rooms, so that at the present time, for a normal working-class family, consisting of father, mother, and children of both sexes over twelve years of age, a living room of adequate size, three bedrooms, and the necessary offices, is considered the minimum standard of health and decency. The Royal Institute are of opinion that every house should have a bathroom, and, if to health and decency are to be added convenience and comfort, the addition of a parlour is essential.

On the question of lay-out, construction of roads, sewers, and of buildings, the Royal Institute do not think it would be useful in this memorandum to discuss these in detail, but would observe that there has been a concentration of attention upon these matters during the last four years unparalleled in quality and extent. In view of this fact His Majesty's Government is asked to reconsider the report on By-laws, the Tudor Walters' Report, and the Ministry of Health Housing Manual, in the light of the experience which has been gained since these admirable reports were framed. The Royal Institute would be glad to place the wide experience of its members at the disposal of the Government.

As is generally recognised, the difficulties in the way of making a proper provision for the housing of the working classes are threefold, and may be summed up as those of money, materials, and men. On these three matters the Royal Institute make the following observations.

Money.

This difficulty arises from the fact that dwellings of the minimum standard before described cannot be provided without financial assistance at a rent within the capacity to pay of a large section of the working classes.

The Royal Institute therefore recognise that financial assistance is essential, but desire to point out that in giving financial assistance, regard should be had to its effect in increasing demand to a point at which inflation in prices and wages ensue. They also desire to emphasise the importance of a high standard of housing as an essential condition upon which financial assistance by the State should be given.

Materials.

The Royal Institute lay the greatest stress upon their opinion that the materials best suited for house building are those which long experience and practice have brought into use. They do not desire to discourage experiments in new building materials, but are strongly of the opinion that the experience of the last four years, if examined, would be found overwhelmingly in favour of the materials in common use before the war.

In their opinion the difficulty in securing an abundant and cheap supply of such materials is largely associated with fluctuations in demand. The inflation of prices which followed upon the abnormal demands made upon the sources of supply in 1919 and 1920 should not be forgotten. The Royal Institute do not desire to see this repeated, and are of opinion that it will inevitably follow the attempt immediately to carry out a housing programme beyond the present capacity of the building industry. They are of opinion that the development of material supplies will take place with the minimum of inflation if the housing programme adopted is so carried out as to cover an extended period, commencing with a number within the compass of available resources, and increasing to the maximum that is required by steady increments.

The Royal Institute are, moreover, of the opinion that the element of cost in house building, which is due to the price of materials, should be isolated and made known, so that a correct opinion upon it may be formed. For this purpose the Royal Institute consider that the work of the committee on the prices of building materials is of the utmost importance, and that the scope of the reference to this committee should be enlarged if necessary, so as to enable it to make recommendations on the methods best calculated to secure an adequate supply of materials at reasonable prices.

Men.

The question of output in relation to labour is as obscure as the cost of production in relation to materials, and the Royal Institute are of opinion that it is as essential to isolate this element of cost and make it known as in the case of materials, and they therefore recommend that the Government should be asked to inquire into this matter contemporaneously with their inquiry into the price of materials. The Royal Institute are also of opinion that to avoid inflation, the necessity for an extended programme beginning with a demand commensurate to the capacity of the building industry, and increasing to a maximum, is as imperative in the case of labour as in that of materials. The man-power of the building industry was seriously depleted by the requirements of the war. This depletion was felt by an industry already suffering from the effect of the depression in the building trade which preceded the war, and is greatly accentuated by the fact that the apprenticeship system has broken down, and has not been replaced by any other means of recruiting the industry. The Royal Institute cannot too strongly express the view that the solution of the housing problem depends more than anything else upon an increase in the number of men employed in building. Holding this opinion they recommend that the Government should at once consider what steps can be taken in view of the failure of the apprenticeship system to secure the annual entry of sufficient numbers into the building industry.

The Effect on Building other than Housing.

The Royal Institute are of opinion that the attention of the Government should be drawn to the fact that house building has hitherto engaged but a small part of the activities of the building industry. Those activities are threefold:—

(1) The maintenance of existing buildings.

(2) The provision of buildings for commercial, industrial, and public purposes.

(3) The provision of dwellings.

It is clear that an abnormal demand upon a depleted industry for the purpose of house building must re-act unfavourably upon the cost of maintenance and the provision of buildings other than dwellings. It would be a penny wise and pound foolish policy, either to let old buildings sink into disrepair, or to cripple the expansion of trade and industry at a time when unemployment is so great. Both these considerations point to the conclusion already expressed that a housing programme, while outlined on a sufficient scale and carried out with vigour and determination, must have regard in its earlier stages to the present capacity of the building industry.

The Royal Institute are of the opinion that the housing of the working classes is a permanent task and not merely a passing problem and that whatever machinery be set up for its performance, it is essential that architectural experience and practice should be employed to the fullest extent.

THE WEEK IN PARLIAMENT.

Westminster, *Wednesday.*

Parliament re-assembled on Tuesday, February 12.

Schemes Approved.

Replying to questions, Mr. Wheatley, Minister of Health, said that up to February 1 approval had been given by the Ministry of Health to schemes proposed by local authorities for 95,715 houses, of which 33,994 were to be erected by local authorities and 61,721 by private enterprise. In respect of the houses to be erected by the local authorities themselves, contracts had been entered into concerning 18,687 houses. As regarded the houses to be erected by private enterprise, certificates had been issued on the approval of plans for 36,543 houses. Since the passing of the Act of 1923 loans amounting to £2,153,595 had been sanctioned to local authorities for the purpose of making advances to prospective owner-occupiers, or to persons undertaking the erection of houses. The total number of houses authorised under the Housing, &c., Act, 1923, up to December 31 last was 85,036, of which 31,434 were to be erected by local authorities and 53,602 by private builders.

Housing Policy.

The Prime Minister, in outlining the housing policy of the Government, said that the view of the Labour Government was that only the fringe of the problem had been touched. They were considering at present the problem in its essential characteristics, and he hoped that, before long, the Minister of Health would be able to present detailed proposals. The first thing to consider was that the housing problem could only be solved when decent human homes were provided for the mass of the working-classes at rents that could be borne by the average income of those classes; and, secondly, that, in the production of those homes, it would be necessary to get the material and labour necessary for that production. The first point—the point of price—had been met since the war by the subsidy, and he was afraid that would have to be continued. It would be continued in relation to the problem of how to build houses, on the average, for £500, and let them, on the average, for 9s. per week, including rent and rates. Not ten per cent. of the houses built under the Addison scheme were inhabited by the class of people whose needs must be met if the housing problem was to be solved; and the 1923 Act of Mr. N. Chamberlain's was only going to be fruitful in the building of houses for sale. That did not solve the problem.

Dealing with the problem of labour, the Prime Minister said that to-day they had only 50 per cent. of the men in the building trades that they had in those trades before the war. Because private building had failed. The trade had become so disorganised that a decent person, thinking of his child's welfare, chose some other channel of trade. With regard to dilution, the first thing to do was to give the building trade a guarantee of continuous work over a certain number of years. There was no difficulty about that, because the shortage of houses was now so great that all that was required was to create a programme that would stretch over a certain number of years. Beyond that, the workmen asked, perfectly rightly, for a guarantee that the inrush of men into the trade should not swamp them completely, reduce their wages, and still further disorganise their trade. The spirit of the conference which the Government had called between employers and employed had been admirable.

THE BUILDING TRADE.

THE TWO DEMANDS.

By A BUILDING CONTRACTOR.

[We print the following suggestive article, by a well-known building contractor, as a basis for discussion of matters of considerable importance to the industry, but they are the writer's views and are not necessarily ours. —ED.]

AT the present time there are two demands before the building trade. One is from the operatives for an increase of wage, and the other is from the people of Britain for buildings at a more reasonable cost. Both of these require careful consideration.

In the following remarks the writer is simply stating his own opinion and not that of any organisation.

Dealing with the demand for an increase of wage, any man who lives in comfort and considers in detail the expenses of maintaining his own home must come to the conclusion that, if at all possible, the scale of living of the skilled worker should be raised, and the term "skilled worker" should include not only the joiner and bricklayer, but also the intelligent and skilled labourer, scaffolder, hod-carrier, drainer, etc., as a man cannot learn to become a first-class labourer without several years' severe training.

After analysing the costs of maintaining a home the practical idealist will find that a reasonable ideal at which to aim under present conditions of living would be about £300 per year for the highly skilled and industrious tradesman, and £225 per year for the expert and hard-working labourer. At the same time the demand of the people of Britain for respectable homes at a cost which they can afford to pay needs even more urgent consideration than the question of wages. First it may be laid down as an essential principle that the building industry should be so organised as to need no Government doles or subsidies to support it. There should be no bolstering up one industry and its workers by putting a burden upon other industries and other workers. Further, the higher scale of living desired by the building community should not involve an increased load upon other industries which are already sufficiently tried through competition with the foreigner.

Is it possible for the demands of both the building operatives and of the community to be met? The writer, after considerable experience in the building trade, believes that it is. How?

By developing the highest type of operative, more skilled, better educated, better fed, better housed, and with even greater self-respect than at present. The first step in this direction is that all men should be paid by the result of their labours rather than as at present for the time spent on producing the result. It is the more honourable and manly way, and it will gradually evolve a more skilled type of workmen.

When we watch the skill and dexterity of the first-class worker in some of the trades where payment is made according to the value of work done, and compare it with the slow and awkward movements of many who are paid according to the time spent, we see the one method gradually evolving a higher type while the other results in gradual degeneration to a lower type. But many workers bitterly oppose payment by result, remembering all the evils of sweated labour and its association of blood for money.

Need this necessarily be the spirit of payment by result?

Some of the best industries in Britain are paid by result, and in Australia, considered to be the most completely organised labour country in the world, much building work under the highly developed trade union rules is paid by result.

The trade unions of the building industry in Great Britain are strong, and in conjunction with the employers' federations can surely be trusted to look after the welfare of the operatives.

The following are suggestions which could be modified in discussion:—

Where workers are to be paid by result, let there be an agreed minimum wage at a rate decidedly higher than the day-work rate, say 10%; let the rate for work done be decided upon, the operative in the first case to receive his hourly wage plus 10%, and then let the balance between the amount spent and the agreed price for the work done be divided between the employer and the operative. The result should at least add 20% to wages without adding anything to the cost of the work, while it could safely be reckoned to add 33% to the operative's wage and reduce the cost 10%. This would tend to prevent the employer desiring to cut down unreasonably the price of the work done, as if his men did not make a bonus he would lose considerably.

A secondary economy would lie in a smaller margin for profit for the building contractor. Competition usually forces his profit down to the lowest figure compatible with safety. His principal risk at present is variation in the cost of labour. Payment by result would reduce this risk and allow estimates to be more closely calculated, with a corresponding national benefit.

Further, as the employer's and operative's interests would be identical, the worker would be ready to point out any errors in organisation which would ensure more careful organisation than at present. This change, while a benefit to the workers and community, would not be a financial advantage to the highly developed firm of contractors who now thrive in competition with their less organised and skilful brothers, but in the development of the industry and the consequent national benefit there would doubtless be indirect compensating benefits to them also.

There are difficulties in the revolution of an industry as outlined, such as how to accommodate it to difficult classes of work, adjustments with regard to labour on the high grade university, or church, and the humble cottage, and there is the question of ensuring that the work shall be of good quality.

DILUTION IN THE BUILDING INDUSTRY.

IN the course of a letter to the *Times*, Mr. C. Jesson, writing on behalf of the British Workers' League, states: "The building trade operatives undoubtedly see that the coming of concrete houses is going to revolutionise their industry. Whole housing schemes are now being carried out in various parts of the country, consisting entirely of concrete houses that require only 10 per cent. of skilled labour to build. These houses are not only solving the problem of the dearth of skilled labour, but as over 70 per cent. of the necessary material can usually be found on or near the building sites, there is also a great saving in haulage. Experts are claiming that these concrete houses are both dry and warm in winter and cool in summer, and can be made to look equally attractive as houses built with baked earth, *i.e.*, clay. They should also be considerably cheaper to build than brick houses, which, again, should prove a boon to the unfortunate worker who has to pay from one-third to one-half of his wages for rent, while the heavy losses on most of the recent housing schemes, which have to be made good from the rates and taxes, add considerably to the cost of living."

THE MASTER CARVERS' ASSOCIATION OF LONDON

THE members of the Master Carvers' Association of London held their 26th annual dinner at the Connaught Rooms on February 17. The President, Mr. Laurence A. Turner, F.S.A., was in the chair.

After the loyal toasts had been honoured the President, in proposing "Our Guests and Visitors," said he placed those who represented architecture first because their relation to the Master Carvers was similar to that of the Solicitor to the Barrister.

Mr. H. B. Judge then responded, and Mr. W. Aumonier, in proposing "The Ladies," welcomed the fact that they had the daughter of such an eminent craftsman as Mr. Walter Frith to respond to the toast.

Mrs. E. Frith, in reply, said she hoped the comradeship which existed between master and man in their Association was a sign that carving had not degenerated into the prevalent commercialism of the present day.

Mr. Gilbert H. Jenkins, F.R.I.B.A., then proposed the Master Carvers' Association, and said architects were only too glad that they had such a splendid body as the Master Carvers' Association to assist them in making their buildings beautiful. Carving was an art even older than architecture: Palæolithic man practised it. While architecture in England during the thirteenth century could not claim to be superlatively better than that on the Continent of Europe, the English carvers, on the other hand, produced a new form of carving as fine as anything which had been done since. The detail in the early cathedrals was better than the work of their French brothers. Not only was it wonderful carving, but they upset the squeamishness of their monkish clients: the carver was always a free man until the architect came along.

Mr. J. D. Daymond, in reply, said he hoped they would do their best to live up to the traditions of the Association. The late Mr. Bentley once remarked that there was no room in heaven or earth for a bad carver.

Mr. W. D. Gough, in proposing the health of the President, reiterated the pleasure they all had in the happy position of affairs between operatives and employers.

The President, in briefly responding, said the body of men employed in carving was small compared with other crafts and trades; and he considered that carvers should be a separate body from men who were little more than mechanics. He hoped that their men would strive to do more than merely imitative work.

In conclusion Mr. A. T. Bradford proposed a vote of thanks to the artistes.

During the evening a six-reel living cinematograph performance, of which the author was the Hon. Secretary, was given. The letterings of the close-ups, executed by Mr. A. Aumonier himself, showed the craftsmanship of the Association at its best.

The Master Carvers' Association was founded in 1897, and consists of employers of architectural sculptors, stone carvers, wood carvers and modellers. The objects of the Association are the promotion and protection of the above crafts generally and the members of the association in particular.

Builders' Estates.

Mr. Jonathan Sanderson, of Lydgate-lane, Sheffield, builder (net personalty, £7,10[illegible]), £8,656.

Mr. Robert Mickel, J.P., of Rivaldsgreen, Linlithgow, formerly a timber merchant in Glasgow, and the builder of many houses and business premises in London, £25,699.

THE ROMANCE OF BUILDING THROUGHOUT THE AGES.—II.

THE second* of this series of lectures, given by Mr. George W. Thompson to the junior members of the Amalgamated Society of Woodworkers, at Liverpool, dealt with the following periods:—(1) Western Asiatic (including Chaldean, which was the oldest); (2) Assyrian, when Nineveh was built; and (3) Persian, when Cyrus had conquered this region (2458 B.C. to 330 B.C.).

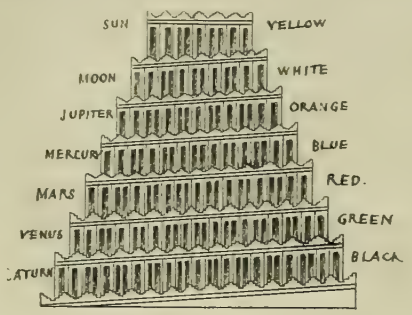
The art of that period was, he said, generally referred to as Assyrian. Assyrian art was young compared with Egyptian, but it was old compared with Greek and Roman.

Fragments of palaces and much ornament had been excavated. Brick and coloured tiles were the materials used for main buildings, while sculpture was done on stone. Whereas Egyptian remains were mainly temples and tombs, Assyrian remains were chiefly palaces. Assyrians were not so cultivated as the Egyptians, but were more warlike. Egyptians doubtless felt that nothing was too costly, grand, or permanent for the houses of their gods.

In the old days in Egypt, Greece, and in this country, when cathedrals were being

FIG. 1.

built, craftsmanship was at a high level, and the present-day craftsman should endeavour to obey more completely than he usually did the voice that exclaimed: "Whatsoever thy hand findeth to do, do it with all thy might."



Features of Assyrian art were the great winged human-faced bulls, and bull-headed giants shown engaged in the sport of taming lions and bulls. Alabaster vases had been found decorated with sculptures of ducks, pigs, fish, and squatting monkeys. A peculiar feature of both Egyptian and Assyrian art was the observance of what was known as "The Law of Frontality," that was to say, the sculptured bulls, lions, vultures, and human figures were always shown looking straight ahead; there was no deviation of the face from right to left.

The arch was used by the Assyrians.

The City of Babylon was 60 miles in circumference. It had walls 300 ft. in height and 72 ft. broad. The Temple of Baal was half a mile in circumference, and over 600 ft. high, and the hanging gardens were considered to be one of the seven wonders of the ancient world.

Only fragments of the architecture of this period remained. The palaces were of great size and were erected on mounds. Brick and coloured glazed tiles were the materials used for the principal parts of buildings.

The ancient cities of Western Asia were situated on the Rivers Tigris and Euphrates.

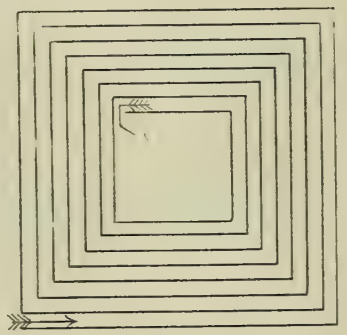


FIG. 2.

This district, which was now called Mesopotamia, was one of the earliest seats of civilisation. The exceptional fertility of the soil enabled an immense population to be supported in and around the cities of Babylon and Nineveh.

The more modern city of Mosul stood near the site of Nineveh. The temples were sometimes surmounted by an observatory. That at Khorsabad was dedicated to the seven heavenly bodies, and the several stories were built in terraces. The inclined path surrounding the terraces formed the means of approach to the summit. Each terrace differed from the others in colour; the lowest tier was black, for Saturn; the second green, for Venus; the third red, for Mars; the fourth blue, for Mercury; the fifth

FIG. 3.

orange, for Jupiter; the sixth white, for the Moon; and the temple on the summit was thought to have been yellow, for the sun.

It was interesting to note that the angles of these buildings were made to face the cardinal points (north, east, south and west), in contrast to the Egyptian pyramids, whose sides faced the cardinal points. It was not known why the Babylonians erected such lofty structures as these, but it was worth recollecting that the Book of Genesis, chap. 11, verse 4, referred to the attempts they made to build towers that

FIG. 4.

should "reach to heaven"; they worshipped the heavenly bodies, such as the sun and moon, and elemental natural phenomena, such as wind and thunder.

Fig. 1 is an alabaster slab showing the Assyrian sphinx, from the Louvre; Fig. 2 shows the Observatory at Khorsabad, with terraces dedicated to the seven heavenly bodies; a capital and base from the ruins of Persepolis are seen in Fig. 3—these capitals were of the "double-bull," "double-unicorn," "double-

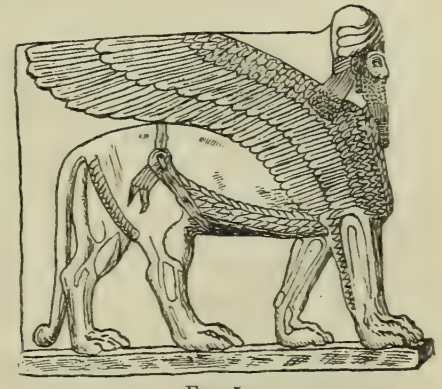

FIG. 5.

horse," or "double-griffin" type; two pieces of Babylonian sculpture are shown in Figs. 4 and 5—the former is a sculpture of a dog, while the latter is of a winged human-headed lion.

Refuges in the Mall.

The Office of Works has lately begun an experiment in the interest of the safety of persons using the Mall. This particularly wide thoroughfare is at all times, and particularly during the evening, extensively used by fast motor traffic. A series of new refuges has been laid down the middle of the road, and at night each is illuminated by an electric light contained in a pillar about 5 ft. high. The light shows red to traffic passing up and down the roadway, and white to either side, for the guidance of pedestrians on the sidepaths. While conducing to the principle of "Safety First," it is doubtful whether these refuges add to the harmony of the Mall in general. Only a short while back we woke up to find our refuges had become famous by the addition of silver and aluminium paint.

Building in Norway.

In Christiania houses arranged in flats constitute 57 per cent. of all the city's buildings. In all other Norwegian towns houses of one or two stories predominate. Wood is a much-used material, and barely one-sixth of the houses in Norwegian towns are brick. Christiania and Aalesund—the latter was destroyed by fire some years ago—are the only towns where brick dominates.

* The first lecture was given in our issue for February 1.

THE "DUO-SLAB" SYSTEM OF CONCRETE COTTAGE CONSTRUCTION.

We illustrate herewith the "Duo-Slab" system of concrete cottage construction, which is now being extensively adopted by several local authorities for their new housing schemes. This system has been developed by Messrs. Wm. Airey & Sons, Ltd., of Greek-street Chambers, Leeds, who have built over 3,000 "Duo-Slab" houses, and have other large contracts in hand.

The system is essentially one for the mass production of houses on a unit system, although the unit can be varied to suit any design. On the Leeds scheme (where some 1,600 "Duo-Slab" cottages have been built) the "unit" is 4 ft.—the distance between the centres of the piers (see Fig. 1). The houses may, of course, be finished with roughcast, cement rendering, or any desired method.

The wall is formed of pre-cast slabs laid on edge one above another with a vertical space between each tier of slabs which is filled in with concrete poured *in situ*, thus binding all the slabs together at their ends.

Moulding the Slabs.

Although the slabs may, of course, be of any desired size, in the cottages illustrated (which are all on the Leeds housing scheme, for which Mr. H. S. Chorley was the architect), they are 3 in. thick by 8 in. high. The ends are splayed in order to get a stronger bond at the piers, and the length of the slabs is 3 ft. 8 in. on the longer face and 3 ft. 6 in. on the shorter face (see Fig. 5). The piers measure 8 in. across the face of the wall, and thus occur at 4 ft. centres all round the cottages. The slabs are formed of a concrete consisting of 5 parts hard clinker, 1 part sand, and 1 part Portland cement.

A patent mould is used for the manufacture of the slabs. As shown in Figs. 1, 2, 3 and 4, the mould consists of a wooden frame hinged at three corners and having fastenings at the other corner, so that it can be stood up on edge to enclose a rectangular area a little deeper than the thickness of the slab (so that there will be sufficient depth for the concrete necessary to form the slab before it is consolidated) or opened out in order to remove it from the finished slab. The area enclosed by the slab is the length of the slab and sufficiently wide to enable three slabs to be formed, face up, side by side and separated by longitudinal runners or division plates. A plan of the mould is given in Fig. 1; Fig. 2 is a side elevation; Fig. 3 an end elevation showing one of the hinged corners and the corner which is locked to keep the mould in position; Fig. 4 is a side elevation showing three moulds placed one above another (the hinged corners are on the right and the locked corners on the left). The vertical alignment of one mould above the other is ensured by two iron straps on each face which project downwards and pass over the face of the mould immediately below; or, alternatively, by pins fixed in the bottom of the mould entering holes in the upper edge of the mould below.

The tamping is performed by placing over the top of the mould a board with a rebated edge. The rebates project over the top of the mould, so that when pressure is applied the board (except for the rebates) is pressed into the concrete until the rebates come to rest on the edges of the mould, thus ensuring uniformity in the thickness of the slab. The pressure is applied by a man stamping his feet on the board, or by striking the board with a rammer.

After the first three slabs have been made in the bottom mould the tamping board is removed and the concrete covered with paper or sprinkled with sawdust. Another mould is then placed on the first, and a fresh batch of concrete poured, tamped, and covered with sawdust, and this operation is repeated until a height is attained beyond which it is inconvenient to work, usually about 12 moulds. The forms are removed the following day and used again, and the slabs left to cure. The removal of the moulds is an extremely simple matter, all that is necessary being to unfasten one corner and walk round the pile of slabs "unfolding" the mould away from the slabs. By this method the slabs are all made quite close to the site where they are to be used (see Fig. 0, which shows the slabs alongside the footings), and the unnecessary labour often entailed by carrying blocks on pallets away from the moulds to a curing ground and back again to the site of the work is eliminated. We are informed that with the use of these moulds it is possible for one trained labourer to make 100 slabs per day, and as cottages of the type being built by local authorities require on an average 1,000 slabs, it therefore takes ten days for one man to make sufficient slabs for one house.

The walls are formed of two leaves, with a 2 in. cavity between, making a total thickness of 8 in. The blocks are of the same size for both leaves, and no variation is made in the concrete for the external and internal walls.

The method of erection is to place the slabs on edge one above another without horizontal mortar joints, strips of wood, which also form the sides of the piers and are afterwards removed, being used as distance pieces. The distance between the slabs along the outside of the wall is 6 in., and on the inner face 4 in., the difference being accounted for by the chamfered edges (see Fig. 5). As the slabs are laid shuttering is erected to enclose these spaces on the outer faces of the two leaves forming the wall, and pieces of wood are placed inside the cavity 3 in. from the ends of the slabs. Within this shuttering concrete is poured *in situ*, forming a solid pier throughout the height of the wall at 4 ft. centres.

In the construction of these piers a patented system of shuttering is employed (Figs. 6, 7 and 8). When the slabs (*a*, *a*) have been placed in position the uprights (*f*, *f*) of the framework are first placed in their vertical position as at Fig. 6, that is, on the outer surface of the two rows of slabs, horizontally across the space between the edges (*e*, *e*), and with cross pieces (*j*, *j*) transversely across the two rows of slabs forming the wall. The uprights of the framework are locked in a plumb position by the upper transverse loops (*l*, *l*) and the screw shaft (*q*). The wedges (*u*, *u*) act as distance pieces and also retain the slabs in position and press the outer surface of the latter against the portions of the uprights below the pivot bolt (*k*). When the concrete which forms the pier has

Mr. H. S. Chorley, F.R.I.B.A., Architect.

been run it is allowed wholly or partially to set, and when it has become hard enough to permit of one or both the uprights being removed another set of concrete slabs is placed upon the preceding ones, and after the framework has been released by the withdrawal of the wedges it is raised and readjusted to the new position, when the operation of forming the pier is continued until the wall is carried to the required height. Fig. 6 is a plan showing the shuttering in position, with a pier shown in section; Fig 7 is a front elevation of the shuttering; Fig. 8 is a side elevation of the apparatus with the slabs shown in section. This system ensures that the walls are built true, and the metal facing to the wooden framework results in a smooth finish.

Fig. 1 shows the "Duo-Slab" system of walling in course of erection.

Letters patent have been granted to Messrs. Wm. Airey & Son, Ltd., for this special form of concrete house construction; the Company, however, has already granted licences to several contractors and are prepared to issue licences to other approved contractors for the use of the system in the erection of houses, on royalty terms, which have been approved by the Ministry of Health.

NATIONAL ASSOCIATION OF SHOP FITTERS.

ANNUAL DINNER.

Mr. G. A. Coulson (President) occupied the chair at the annual dinner of the National Association of Shopfitters, at the Restaurant Frascati, on February 7, when amongst the guests were Messrs. W. H. Nicholls (President, National Federation of Building Trades' Employers), H. T. Holloway (President, London Master Builders' Association), E. J. Brown (Director), and A. G. White (Secretary of the National Federation of Building Trades' Employers).

Mr. W. H. Nicholls, in proposing the toast of "The National Association of Shopfitters," said that body could not have a man to guide it of greater capacity than Mr. Coulson. Standing as he did for the spirit of federation and co-operation amongst employers engaged in kindred industries he had given consideration to the connection between the two bodies, and his conclusion was that this connection so far had neither been sufficiently definite, nor sufficiently to the advantage of both organisations. Speaking generally, the craftsmen and the materials employed by shopfitters were the same as those used by builders, and therefore they ought to realise that if they were to hold their own in the near future they must sink any differences—if there were any. They had to realise that there was a distinct intention on the part of the mass of the community to exercise a larger control in the industrial life of the nation. On reflection, he was not sure that this would not prove to be for the good of industry, provided that certain social factors came along. Faced with this condition of things it behoved employers to group themselves together for protection and advancement unless they were to be beaten in the struggle. Those present were employers who believed in the individual putting all his capacity into his work, and showing what he could do, and a definite duty devolved on them to associate themselves together to protect their interests. He was sure the National Builders' Federation could help the shopfitters, for the whole policy of that body was not to lead its members into trouble, but to keep them out of it. He urged strongly that everyone in the industry should ally himself with the Federation even if it meant a small personal loss. He knew of nothing better than the organising work of the Federation, which would be put at the service of the Association of Shopfitters.

The Chairman said they would appreciate that the National Federation of Building Trades' Employers had offered them the right hand of fellowship, and the Association of Shopfitters would feel all the stronger in consequence and would be inspired with even higher ideals than in the past. Their industry, like that of the building industry, was subjected to troubles owing to firms being unfederated, but the creation of an organising staff by the Builders' Federation would give them the means of approaching other firms and getting them into the Association. Unless they were united they would fall, and so he trusted that next year they would be able to give a good account of themselves.

Mr. E. Pollard (Vice-President of the Association) gave the toast of the "Visitors," and said when they started they framed their rules and came under the protection of the National Federation of Building Trades' Employers; but it was difficult, perhaps, for a powerful Federation to realise that the Shopfitters' Association, small as it was, had a soul of its own, and had aspirations and desires which did not always coincide with those of the master builders. He asked the master builders to recognise those desires, to tolerate them, and even to encourage them. If that were done no trouble would ensue—if more freedom were given less would be required.

Mr. H. T. Holloway, in reply, said the building industry ranged from the heavy constructional work of the civil engineer to the finest specialised work of the shopfitter. Naturally many differences and requirements must arise in such a condition of things, but it was their duty to adjust such differences and work together. It was a fine piece of work when they formed the Association, and a finer piece of work when they linked themselves up with the Builders' Federation in the London area, for they strengthened both themselves and the builders. He was not aware that there were any acute differences, but in the Standing Committee they had a body through which any differences could be adjusted. They lived in critical times, but on the other hand they had never had a more favourable time for extending the work of organisation.

Mr. C. E. Speaight also responded.

Mr. P. Josephs proposed the health of the Chairman, which was enthusiastically honoured.

Welfare Movement.

Messrs. Mander Brothers' welfare movement was started in 1920 to continue the personal relationship between employer and employee, which, naturally, expansion of business rendered difficult. It has since made rapid progress, and in connection with this development great assistance was rendered by the Industrial Welfare Society of 51, Palace street, London, S.W. 1, which has accumulated a mass of valuable experience on these matters and is in a position to give expert advice to those taking up this important side of industrial activity. H.R.H. the Duke of York is President of the Society, and its Council is composed of a number of the leading employers and labour leaders of the day, the work being carried out under the general direction of Mr. R. R. Hyde.

The committee of the Welfare Movement discusses in a frank and open way any question which is at all relevant to the business or industrial conditions, though it should be said that wages and hours are settled for the whole of the paint, colour and varnish industry by a National Joint Industrial Council.

The scheme has been a great success, owing to the willing and enthusiastic co-operation of all concerned.

FENCING AND OTHER SAFETY PRECAUTIONS FOR WOOD-WORKING MACHINERY.

THIS safety pamphlet* contains the wood-working machinery regulations 1922, relating to the duties of occupiers and the duties of persons employed in connection with the provision and efficient use of safeguards for wood-working machinery. It has been in the past far too usual to neglect to provide adequate shields to fast-running machinery, or to use such appliances even when they have been provided. Such carelessness, always reprehensible, has now become illegal and occupiers are required to install adequate shields which persons employed must use "except when owing to the nature of the work being done the use of the guards or appliances is rendered impracticable." This proviso puts a heavy responsibility upon inspectors and opens up the possibility of divergence of opinion in cases of claims for compensation following upon accidents, but in view of the extreme range in the nature of work done on modern machines the exception has, at the present moment, some colour of justification.

Rules as to the lighting arrangements at points where wood-working machines are installed should prove of great practical value, both in regard to safety and in efficiency of output. Bad or indifferent light, or, what is worse, brilliant light injudiciously placed where it will dazzle the operative's eyes or cast a shadow upon the cutting edges, has been responsible for a great many accidents in the past. The floor in the neighbourhood of the machine must be kept level and, as far as practicable, be maintained free from chips, and must not be allowed to become slippery. The training of persons in the work of machine joinery must include careful instruction as to the dangers arising and the precautions to be observed, and "no person shall be employed at a wood-working machine unless he has been sufficiently trained to work that class of machine or unless he works under the adequate supervision of a person who has a thorough knowledge of the working of the machine." Detailed regulations are also given of the nature of safeguards required with specific classes of machinery.

The body of the pamphlet is devoted to the explanation of these requirements and suggestions for efficiently putting them in execution. The advice is of an eminently practical order, and the devices suggested have in many cases commercial advantages, in addition to their primary object of securing safety in working. A really adequate safety device will not be cumbrous in use and may even lead to increased speed through the confidence it inspires. To attain this end, all connections must be devised in accordance with the dual requirements of the case. A shield to a piece of running machinery must be firm and rigid when in position; if it is not itself to become an additional source of danger it must deserve the confidence its presence should inspire. On the other hand, it must be capable of being fixed or detached with ease and without loss of time, for notwithstanding legal enactments a shield troublesome to fix would be thrown aside unused. The combination of shield and dust extractor is strongly recommended in the book and should be carefully considered by those in charge of wood-working machinery. The pamphlet is one which should interest all modern wood-workers.

*Safety Pamphlet No. 8. Issued by the Home Office. London: Published by His Majesty's Stationery Office. Price, 1s. net; by post, 1s. 1½d.

Tender.

The contract for painting the L.C.C. Seawell-reet School, Shoreditch, has been obtained by essrs. Turnbull & Son, London, at £923. essrs. Lister & Co. having withdrawn their nder.

RATES OF WAGES IN THE BUILDING TRADE.

The following are the rates of wages in the building trade in England and Wales. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur:—

	Masons.	Bricklayers.	C'p'ters. Joiners.	Plasterers.	Slaters.	Plumbers.	Painters.	Labourers.
Aberdare	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2¾
Accrington	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2¾
Altrincham	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2¾

(For rates of wages in the Building Trade in Scotland, see page 282).

CONTRACTS, COMPETITIONS, &c.

For some contracts still open, but not included in this List, see previous issues. Those with an asterisk are advertised in this number. Certain conditions beyond those given in the following information are imposed in some cases, such as that advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in; the name and address at the end is the person from whom or place where quantities, forms of tender, &c., may be obtained.

Electric Tramway Co., Ltd.; Messrs. Massie & Holdsworth, two houses in Belgrave Mount, for Messrs. T. B. Broadhead and H. C. Longbottom; two houses in Dickinson-street, for Mrs. M. Walker; two houses in Park Lodge-lane, for the Victoria Coal and Coke Co., Ltd.; Mr. W. Wrigley, house in Many Gates-lane, for Mr. W. E. Stephenson; Mr. G. Hope, house in Thornes-road, for Mr. R. Briggs; and Mr. J. P. Firth, house in Hanshaw-lane, for Mr. J. Butterworth.

Wallsend.—The T.C. has decided to apply for sanction to borrow money for the erection of 36 houses, and also to seek permission to borrow £12,000 for privy conversions.

Watford.—Plans passed by T.C.: Six houses, St. Albans-road, for Messrs. Kempster & Williams; two houses, Rickmansworth-road, for Kempster & Williams; bungalow, Oxhey-road, for Mrs. C. Allen; bungalow, Oxhey-road, for Mrs. M. Turton; three shops, St. Albans-road, for Kempster & Williams; house, Pinner-road, for Mr. G. W. Pitkin; two cottages, Gammons-lane, for Mr. F. Pearce; house, Hempstead-road, for Messrs. Clark Bros.; house, Whippendell-road, for Messrs. D. & C. Eames; lay-out plan of new roads off Rickmansworth-road, for Messrs. Clifford & Gough; bungalow, Queen's-avenue, for Mr. Lewonski; house, Bucks-avenue, for Mr. W. B. Rodnight; house, Oxhey-road, for Mr. H. E. Browne; house, Oxhey-road, for Mrs. R. J. Clay; house, Gammons-lane, for Mr. W. Wells; house, Buck's-avenue, for Mr. S. G. Knowles; house, Buck's-avenue, for Mr. E. F. Gill; house, Mildred-avenue, for Mr. G. A. Cox.

Weymouth.—Plans passed by T.C.: Four pairs of semi-detached houses, Southland-road, for Mr. K. Openshaw; bungalow, Old Castle-road, for S. A. Jackson.

West Hartlepool.—The E.C. scheme for the erection of new schools to accommodate 700 children has been approved by the B.E.——The T.C. have approved the following plans: Mr. C. Turnbull, two houses, Caledonian-road; Mrs. Spawls, house, Caledonian-road; Mr. J. L. Mason, bungalow, Caledonian-road; Mr. W. Brazell, pair semi-detached villas, Lindon-grove.—The Corporation have received sanction from the M.H. to borrow £18,090 for housing purposes on the Raby-road estate.

Wickwar.—The endowed schools are to be improved by the Gloucestershire E.C. at a cost of £1,550.

Wimbledon.—Plans passed by B.C.: Mr. F. E. Hall, house, Pepys-road; Mr. R. J. Thomson, house, Ridgway-place South; Messrs. Jones Bros., shop, 148, Merton High-street; Mr. H. A. Sargeant, house, Belvedere-drive.

Winchester.—Plans passed by R.D.C.: House, King's Worthy, Mr. E. Northover; two bungalows, Horton Heath, Mr. E. Denham; rebuilding part of Rose Cottage, King's Worthy, Col. Thompson.

Wolverhampton.—Plans passed by T.C.: A. L. Bould, bungalow, corner of Crowther-road and Coleman-street; E. J. Duckhouse, house, McBean-road; —. Elkington, house, Lansdowne-road; P. Whithurst and A. J. Morris, two houses, Upper Villiers-street; L. Price Lewis, house, Goldthorn-hill; Wolverhampton Steel & Iron Co., extension of motor house, Horseleyfields.—The L.M.S. Railway Co. are considering the proposed improvements to High Level Station. The Corporation and local Chamber of Commerce are urging speedy action.

Worksop.—The Notts C.C. intends to provide additional accommodation in the Haggonfields district for 350 children.—At the last meeting of the Blyth and Cuckney Council it was stated that 1,500 new houses are to be built in connection with the new colliery which is being sunk at Langold. The first instalment of 100 are about to be commenced, also 10 villas for the colliery officials.

Worthing.—Plans passed by T.C.: House, St. Lawrence-avenue, S. E. Merredew, for Miss Peacock; house, West-avenue, F. G. Abell, for J. T. Lawrence; six houses, St. Valerie-road, for S. W. Phillips & Co.; two houses and garages, Grand-avenue, for W. Weller; house, Brooklyn-avenue, E. J. Love, for Mrs. Richardson; house, St. Thomas's-road, A. Clare, for B. M. Sampson; 18 houses, Leigh-road, R. C. Turnham, for H. F. Carmichael; two houses, Pembury-road, J. E. Lund, for J. Goodman; house, St. Thomas's-road, C. E. Parsons, for W. & C. E. Parsons.

York.—Plans passed by T.C.: W. Johnson, house, 191, Bishopthorpe-road; G. H. Pegg & Son, two houses, Norfolk-street; W. West, house, Layerthorpe; W. West, two houses, Terry-street; G. H. Pegg & Son, four houses, Cameron-grove; Belt & Harrison, two houses, Moorland-road; Vicar and Churchwardens of St. Lawrence's Church, mission-room, Lawrence-street; A. Bowerman, house and shop, Fourth-avenue, Tang Hall Estate; G. H. Pegg & Son, three houses, Norfolk-street; T. Harrison, two houses, Hull-road; J. Pottage, house, Osbaldwick; G. Knowlson, two houses, Skelton-road.

FIRES.

Llanelly.—Damage estimated at £15,000 was caused by fire which completely destroyed Penyfai, the Llanelly residence of Mr. Joseph Holmes, managing director of the Welsh Tinplate & Metal Stamping Co., Ltd.

Nelson.—One of the most serious mill fires in the Nelson district has occurred at the Hollin Bank Mill, Brierfield. The damage is estimated at £100,000, the stock being valued at £50,000 and the buildings at £50,000. The buildings are owned by the Brierfield Loom and Power Company.

Pudsey.—A destructive fire, causing damage which has been estimated at between £40,000 and £50,000, has occurred at South Park Mills, Pudsey, owned and occupied by Messrs. E. Wilman & Sons, spinners and manufacturers.

Treherbert.—A disastrous fire has occurred on the premises of the Bute Colliery, Treherbert (United National Co.). It is estimated that damage amounting to nearly £50,000 was done.

Worcester.—A disastrous fire has occurred at a corn warehouse at Lowesmoor Wharf, occupied by Messrs. Needham.

FEBRUARY 18.—**Larbert.**—HOUSING EXTENSION.—Larbert Housing Scheme extension, consisting of five-apartment houses, for the Eastern District Committee of the Stirling C.C. Plans may be seen with Messrs. A. & W. Black, architects, 5, King's-court, Falkirk, from whom schedules may also be obtained. Deposit £1 1s.

NO DATE.—**Forres.**—HOUSES.—Various works required in connection with proposed Forres Housing Scheme. All particulars from Messrs. R. Carruthers, Ballantyne & Taylor, architects, 28, Queensgate, Inverness.

THE SCOTTISH BUILDER

GLASGOW AND THE NEED FOR TOWN PLANNING.

MR. JAMES MACULAY recently read a paper on this subject before the Scottish Branch of the Surveyors' Institution. After dealing with the past history and development of Glasgow, he said the primary consideration of the people was their health, and, indisputably, the city enjoyed all the necessary natural conditions despite the reputation for rain and dullness. Yet to Dr. A. K. Chalmers (Medical Officer of Health), when he reported in 1911 the movement of population in relation to town planning, the City owed her awakening to the need of dealing with congested areas in her midst. Again, in 1922, his report showed that the average density of population was 56 persons per acre over the whole city; it was as high as 224 persons on every acre in Woodside, 212 in Gorbals, and 175 in Townshead, deducting shops, public buildings, industrial works, &c., from the acreage. The tenement system of housing was responsible for this excessive density, because it led to congestion on space; lighting and ventilation were impeded by similar adjacent buildings, while ashbins in back courts were in almost dangerous contiguity to inhabited rooms. The number of rooms per house was on the average 2.7.

In respect of slums, Glasgow was particularly bad, having some 14,000, which, in ratio to population, made her 50 per cent. worse than Edinburgh. In Glasgow were to be seen the four-story tenements flanking narrow streets, unrelieved by trees or shrubs in most cases, soot-laden and drab, depressing, utilitarian, monotonous.

It was commendable that Glasgow had about 1,500 acres of land in the neighbourhood of Cumbernauld used for farming operations, and in town planning every effort should be made to increase the bonds between the country and the city.

With regard to housing, there was need for provision for all classes of society. The housing schemes at present were planned of three-, four- and five-apartment houses, and large numbers of these were being built over considerable areas.

PROPOSED PRINCES STREET MEMORIAL.

THE Lord Provost Sleigh has received a communication through Mr. John Buchan, who was recently the chief guest at the Edinburgh Burns Club dinner, for a Scottish-American memorial in Edinburgh. Mr. Buchan has been approached by a Scotsman resident in America, on behalf of a number of Scottish organisations in that country, in order that a suggestion might be considered that a memorial of Scotsmen's part in the war should be erected in Edinburgh as a tribute from Scotsmen in America. The suggestion, subject to variation in all details, was that a piece of statuary, probably the figure of a Highlandman, should be erected in Princes-street. If the proposal were approved, the writer of the communication on the subject was prepared to get in communication with the various Scottish societies throughout America in order to meet the cost.

The difficulty is that suitable sites for statues in Princes-street are already occupied. However, it is understood that local views on the form such a memorial might take would be open to consideration on the part of the originators of the proposal.

NEW BUILDINGS IN SCOTLAND.

Edinburgh.—HOUSES.—The Corporation has decided to obtain estimates for the erection of 1,000 concrete houses.——Plans passed by the Dean of Guild Court: A. S. Fairn, two bungalows, Granton-road; James Johnston's trustees, bungalow, Barony-terrace, Corstorphine; Oldrieve, Bell & Paterson, bungalow, Lanark-road, Kingsknowe; Mrs. M. G. Spaven, house, Hillview-terrace, Corstorphine; and A. & R. Scott, Ltd., stores, West Mills, Colinton.

Ardrossan.—CLUBHOUSE.—The Dean of Guild Court has passed plans for constructing a new clubhouse between the two greens, for the Ardrossan Bowling Club.

Cowdenbeath.—HOUSES.—A housing scheme for the employees of the Fife Coal Co., Ltd. Cowdenbeath, was put in hand recently, and the total number of houses contracted for was 500.

Kilmacolm.—HOUSES.—Tenders have been invited for two blocks of houses, consisting of four houses each, at Kilmacolm.

Fraserburgh. — CLASSROOMS. — The School Management Committee for the Fraserburgh area has recommended that an addition be made to the science room, and that three new classrooms be provided at the Academy.

Paisley.—NEW ROAD.—The Dean of Guild Court has passed the following plans: British Cotton and Wool Dyers' Association, Dean-gate, Manchester, to make additions to the works, Greenhill and Underwood-roads; Messrs. Cayzer, Irvine & Co., Ltd., shipowners, 16 Hope-street, Glasgow, to construct at Alt a road, 40 ft. wide, to be known as Lanfin road.

Buckie.—HOUSES.—The T.C. has received permission from the B.H. to erect four m houses.

£100,000 for Houses.

The Epsom Rural Council, which received advanced £50,000 to persons building their houses, has decided to advance a further £50,000. The advances are by way of loan under the Housing and Small Dwellings Acquisition Act

BUILDING TRADE WAGES IN SCOTLAND.*

THE following are the present rates of wages in the building trade in the principal towns of Scotland. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur:—

PAINTING CONTRACT FOR THE EAST HAM BOROUGH COUNCIL.

A DECISION of importance to painting contractors to Borough Councils was given recently by Judge Snagge in the Bow County Court.

Plaintiffs in the action were Messrs. J. M. James & Sons, of 736, Romford-road, Manor Park, E., paint factors and dealers in paint, brushes and materials, and they sued Messrs. Barnes & Co., of 6A, Longhurst-road, Lewisham, S.E., painting and decorating contractors, to recover £74 6s. 2d., for paint, brushes, and other materials supplied.

Counsel for the plaintiff explained that the defendants had had a contract for the painting of two of the East Ham Borough Council's schools, in Walton-road and Essex-road, East Ham. During the course of the work being carried out a quantity of paint and brushes had been ordered by the two foremen employed by the defendants in charge of the work, and the authority for the supplying of these materials had been given over the telephone by somebody in the employ of Barnes & Co. When payment was asked for it was suggested that they had no time to go through the accounts for the moment but that a cheque would be sent on, and then when proceedings had been started the defence was put in on affidavit, that "In August we were doing contract work for the East Ham Borough Council, under certain specifications which included the using of certain material by certain firms appointed by the said Council. Neither I nor my partner has authorised the ordering of, or the acceptance of, goods or material from the plaintiff firm, and the ordering or acceptance of goods or material from them would be a breach of my said firm's contract for the work we were undertaking. There were two foremen on the jobs whom I am informed ordered from the plaintiff firm material without my said firm's knowledge, authority, or consent. These said foremen always had a small sum of money in hand to purchase articles for cash, permission for which would be given by the contract owner. No details of the claim have at any time been supplied to me, although my said firm have demanded same from the plaintiffs."

After various evidence had been heard on both sides, Mr. Smith, counsel for the defendants, addressed his honour, and said it seemed abundantly clear to him that plaintiffs had no right to have supplied the foremen painters with material to the extent that they had done without written authority, and that if they were allowed to do so it would leave the way open to the practice of all sorts of abuse. Of course, if the paint had actually been supplied and used on the job defendants should pay, but there were two points he would submit. First, "Do you believe that paint and materials were delivered?" and second, "Are you satisfied that the goods were used on the job, or another job elsewhere, by the foremen?"

Without calling on plaintiffs' counsel, Judge Snagge said that accepting orders in the way they had been given was a very unsatisfactory way of doing business, and it was very regrettable that no steps had been taken to find the two foremen concerned. He was saved a good deal of trouble as regards the actual use of the material by the affidavit in which the question of the supply, delivery and use of the material was not questioned, and only the authority to order was challenged, in view of the East Ham Borough tender, which excluded plaintiffs from supplying the paint. In his opinion that the deliveries were made there could be no possible question or inference that the materials were used on the jobs. Under the circumstances judgment must be for the plaintiffs for the full amount of their claim, £74 6s. 2d. Judgment was entered accordingly, with costs.

TRADE NEWS.

A new Sanitary Appliance Catalogue containing some 240 pages illustrated with examples of the latest and most modern sanitary equipment has just been published by Messrs. W. N. Froy & Sons, Ltd., Brunswick Works, Hammersmith, W., and will be sent post free to any reader applying for a copy of same. The sanitary showrooms at Brunswick Works, Hammersmith, have been entirely remodelled and enlarged, and the firm will gladly show over any architects or builders who care to pay a visit. Messrs. Froy & Sons, Ltd., also have separate catalogues representing the following departments:—Stoves and ranges, ironmongery, leaded lights, paints, enamels, &c., wall papers, and any of these will be sent post free.

Messrs. James Keith & Blackman Co., Ltd., inform us that the James Keith Hall, Arbroath, which has been given by the Directors as a club for the workers of this firm, was formally opened by Mr. George Keith on January 16.

We are informed that both the offices and depot of the Anglo-Italian Commercial Agency, Ltd., who specialise in Fiat Lorries will in future be at 162, Grosvenor-road, Vauxhall Bridge, S.W.1; the city address has been given up. At 162, Grosvenor-road, there are both garages and showrooms with every facility for demonstrating the model.

We have received from Messrs. J. H. Sankey & Son, Ltd., a short pamphlet dealing with their Cranham-Moler (Fossalsil) hollow partition blocks and bricks.

Messrs. Lumby's, Ltd., send us a list of their unbreakable mild steel corrugated boilers.

NEW COMPANIES.

THE particulars quoted below have been compiled by Messrs. Jordan & Sons, Ltd., Company Registration Agents, of 116 & 117, Chancery-lane, W.C.2, from the documents available at the Companies' Registry.

A. J. HOPWOOD & CO., LTD. (194,198), Registered December 5. London-road, South Benfleet, Essex. Builders and decorators, cartage contractors, &c. Nominal capital, £1,500.

POTTS BROS., LTD. (194,125). Registered December 1. Brick Works, Hoyes-lane, Alderley Edge, Cheshire. Brick and drain pipe manufacturers, now carried on by Potts Bros. at The Alderley Edge Brick and Tile Works, Alderley Edge, Chester. Nominal capital, £2,000.

F. NORTHEAST, LTD. (194,268). Registered December 7. 422, Clapham-road, S.W.9. Builder and joiner, now carried on by Frederick Northeast at 15, York-terrace and 422, Clapham-road, S.W., under the style of Hibberd & Northeast. Nominal capital, £1,500.

HARRY NEAL, LTD. (194,482). Registered December 17. 27, Green-lanes, Northwood, Middlesex. Builder and contractor now carried on at Northwood, Middlesex, by H. Neal, under the style of H. Neal. Nominal capital, £20,000.

F. GLEESON & CO., LTD. (194,493). Registered December 17. 16, Warcock-road, Clarksfield, Oldham. Builders and contractors, &c. Nominal capital, £500.

THE BUILDER

A JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

VOL. CXXVI.—No. 4229. FEBRUARY 22, 1924

THE R.I.B.A. AND EDUCATION.

IT was a happy thought of the R.I.B.A. Council to convene an International Congress on Architectural Education during the summer while the British Empire Exhibition is in full swing. We referred briefly last week to this Congress, which is being held in London at the end of July. Invitations have been widely issued to architectural schools and colleges all over the world, and, falling as it does at the time when London will be full of visitors, it is certain to be well attended. The papers and discussions are, we understand, being arranged to give the different countries represented an opportunity of telling us something of their hopes and aspirations for the future training of their young architects, as well as an historical survey of their methods and developments in the past. American, French and British architects have been invited to read short papers on the past, present, and future aspects of architectural education in their countries, and the other countries have been asked to contribute papers on similar lines to be printed with the former in the book of the proceedings, which is to be published as soon after the Congress as possible. This book should form a unique record of the subject. At a time when we hear so many contradictory opinions on our methods of architectural education, this Congress should afford an invaluable opportunity for discussion of the reasons upon which some of these opinions are based, and, by contact with teachers of other nations, to find by comparison with others the weak points or otherwise in our system and theirs. In addition to the papers, a very comprehensive exhibition is being arranged of the various schools' work. It is intended to house this exhibition in Devonshire House, which has—subject to non-demolition—been very kindly lent to the R.I.B.A., and in addition to hold an exhibition at Conduit-street of a collection of work done in Rome by American, French, and British Prix de Rome winners of recent years. The list of universities and schools who have been invited to send work is too long to print here, but to give our readers some idea of the representative nature of the exhibition we may mention that the list includes, in addition to some 16 British schools, 17 from America, 14 from the Dominions, two each from France, Holland, Spain and Portugal, eight each from Belgium and Italy, four from Russia, and three from Sweden. We believe and hope that in these exhibitions the schools of the British Empire will more than hold their own with those of foreign countries, but, in any event, no one who is interested in architectural education can afford to miss what should prove a unique opportunity of studying the work of many schools in other countries.

In connection with the school system which has grown up during the last twenty years in England, the R.I.B.A. Council, through the Board of Architectural Education, have recently taken two steps of an administrative nature which are of more importance than has, perhaps, been realised, and they will, no doubt, figure in the Congress discussions. In the first place, it has been found that, while the system whereby external examiners, appointed by the university schools under their own regulations, have in practice also acted for the Board in connection with the granting of exemptions from the R.I.B.A. examinations has hitherto worked well, there is one serious defect in it when dealing with a number of schools—some sixteen in all—whose students receive exemption from the Intermediate or Final, or both. In practice it has been found that different external examiners have been appointed by different schools, and it is obviously difficult for the Board to ensure from their reports that an approximately uniform standard of work has been obtained. Mr. Paul Waterhouse in his paper on Education in 1920 foreshadowed the likelihood of a change.

As announced in our issue of February 8, this change has now been made. In future a panel or Visiting Board of Architects, nominated direct by the R.I.B.A., will visit all the schools at frequent periods, both before and after any exemptions are granted. This will in no way affect any appointment by the schools of their own external examiners for their own purposes, but it will ensure that the R.I.B.A. has a full knowledge direct from its own inspectors of the comparative efficiency of the different schools, and will, we think, very much assist the weaker schools in improving their standards. In our judgment this is a wise step and will help still further to raise the prestige of the R.I.B.A. examinations by ensuring that no exemptions are given to young students who have not fully deserved them.

In this connection it is interesting to note that the influence of these examinations is spreading to the Dominions, for only recently the New South Wales Institute has decreed that the R.I.B.A. examination shall form their examination for membership. If this example is followed by other Dominions, the Institute and its Allied Societies abroad will be linked together by one more common bond, which will be all for good.

It is a development which will require some consideration on the part of the Council at a future date in the direction of encouraging men who belong to Dominion Institutes and reside in the Dominions after passing R.I.B.A. examinations to remain in some way attached to the parent body.

The other matter we have referred to above is the poor competition of recent years for R.I.B.A. prizes—another subject which is sure to be discussed at the Congress. Whether this is due to the recent introduction of the Prix de Rome, Jarvis, and other prizes, to the lack of time complained of by the students in the schools, to the conditions and methods of judging the R.I.B.A. prizes, or to other and less obvious causes, we do not pretend to know, but everyone is sorry to see that the Soane and Tite—once the blue ribands of a student's career—are so sadly neglected. We hope that the Committee, which is now sitting to endeavour to find the reason and remedy the fault, will issue its report before the Congress assembles. We feel that the whole question of prizes and competitions for students might well be reviewed at the same time. It may be that there are too many, or that they are not sufficiently co-ordinated with the educational curriculum in the schools, and this again is a matter upon which the Congress might well spend some time and discuss with the other nations represented, who, no doubt, have experienced the same sort of difficulty.

Finally, we sometimes hear complaints that the R.I.B.A Council are too absorbed by the purely business and semi-political affairs of the profession to give time to other and, perhaps, more important work. We ourselves have never lent credence to these suggestions, but we are glad when opportunity offers to emphasise the good work they are doing for education.

NOTES.

Charing Cross Bridge.

Though the paper by Mr. Waterhouse on Monday night was an admirable one in substance, the awakening of imagination and foresight at which it aimed did not seem to have had any good result on some of the principal speakers who followed him. The idea of Charing Cross Bridge appeared to them chimerical and impossible, at least for a long time to come. One of the most powerful pleas for the abandonment of the St. Paul's Bridge is the menace it might offer to the safety of St. Paul's Cathedral, and evidently the Cathedral architect, Mr. Macartney, is very uneasy on that score. Those who have both foresight and imagination, however, look even beyond the safety of St. Paul's to the wider issues involved, and wholly deprecate a muddling and piecemeal policy which fails to take account of the far-reaching effects of such schemes as the erection of new bridges at St. Paul's or Charing Cross. After all, it is not the bridge *qua* bridge we have to think of, but the effect that it will have on transport and circulation, and how its approaches on each side of the river will aid or injure a right development of the city. One of the amazing proposals evolved at the meeting was the erection of a "beauty screen" at each side of the existing bridge, so that the steam railway may pass between two roadways at each side of it, and so perpetuate the old bridge for years to come! On the whole the meeting on Monday does not appear to have been helpful to the cause of progress, though that could not be laid to lucid arguments of Mr. Waterhouse.

Unfair Comparisons.

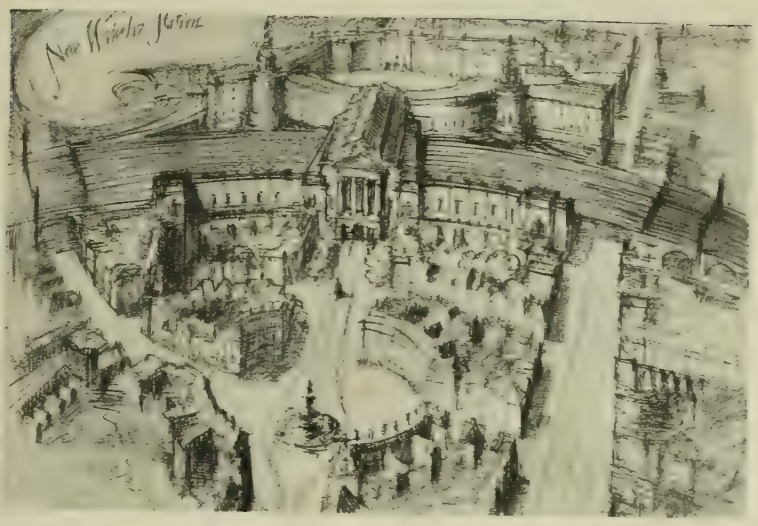
One unfortunate item in the account presented by objectors to a new Charing Cross Bridge is the comparative cost. Is it fair to compare the cost of two millions for St. Paul's Bridge with fourteen millions for Charing Cross? Is it by deterioration of property by the erection of a costly viaduct? There is, at any rate, no need for this in a low-level bridge, which would result in large added values to the land about the approaches on both the north and south banks. We can even imagine an outlay of fourteen millions on a bridge which is wanted being better value than two millions on one which is not, especially if in the former case it results in the fine and beautiful development of an imperial city. There may be no greater curse to the good of a great city than the hide-bound and unimaginative mind of the so-called practical man.

An Art or a Profession?

A very timely article appears in the *Outlook* of February 9, by Mr. Manning Robertson, on "Architecture as an Art or a Profession." He thinks that more outspoken criticism on modern architecture should be forthcoming, and that the duty of looking after the new architecture, which is still in splints, must fall on the shoulders of the architect, even when kindness entails a certain amount of cruelty. He says, as things are to-day, a difficulty arises from the architect's dual personality: "The time has come for the architect to make up his mind once and for all which he is going to be. It he elects to be an artist, half the world will lose faith in him, for how could an artist understand about drains and gas coppers? If he decides on the professional man, the other half will have no use for him, for how can one profitably discuss matters of art with a man who admittedly is not an artist? The present tendency is unquestionably for the architect to regard himself more and more as an artist, and it is his business to make the public realise that artists are not necessarily fools when it comes to practical considerations affecting their art."

Exemption of New Houses from Rating.

We give this week an interesting article by Major Harry Barnes, on "Exemption of New Houses from Rating," in which the objections to the proposal are cogently stated. We have already expressed similar opinions on this method of assisting the production of houses, and we believe that, while local rates have a serious effect on house building, the idea of giving temporary relief would not be a remedy. It is merely another method of avoiding the burden by placing it on other shoulders.



Landscape Architecture.

As might have been expected, the election of Mr. Thos. H. Mawson to the Presidentship of the Town-Planning Institute has given him an opportunity to urge the claims of landscape architecture to a much more

Proposed St. Paul's Station and Approaches. Specially drawn for *The Builder* by the late Adrian Berrington.

important place in the world than it has at present, and that its teaching should be made a more prominent feature in our educational work. That the landscape architect should be a dominant factor in town planning was strongly objected to by Mr. Carby Hall after the delivery of Mr. Mawson's Presidential address; but, however strongly this view may be held by many, there is still ample force in Mr. Mawson's claim for the possibilities which underlie the profession of landscape architecture. After all, landscape gardening and landscape architecture may be two very different things. The new President, with his great enthusiasm, linked with an exceptionally wide experience, should be a valuable asset to a body which has already done so much good work.

Scheme for a New Waterloo Station and Approaches.
Specially drawn for *The Builder* by the late Adrian Berrington.

A Query. As an example of current taste and thought we might instance the cover of the Society of Women Artists' catalogue. We are inclined to doubt whether the insistence of the nude has any necessary or vital import concerning the exhibition. Do we need to be reminded of a figure which we can see in a picture gallery or museum, or every night in a music-hall? To some people, of course, the human figure is the most attractive subject for art effort, but even this is not universal.

Canadian Architecture. A first glance at the recent paper on Canada, by Mr. Percy Nobbs, would suggest a visit to a region with a strong appeal for the architect. The fact is that the English and French traditions, from the England of the Georges and the France of the Louis, produced a particularly interesting type which was well shown in the illustrations to Mr. Nobbs' paper. The French influence as well as the English produced something definitely fresh and quaint in their early colonial work which, as Mr. Nobbs pointed out, was partly ameliorated by climate and partly by the use of that greatest of all timbers, white pine, now well-nigh squandered out of existence: "To build in the good old ways now becomes desperately costly, and that part of the goodness which was craftsmanship is quite unattainable." Fairly to estimate the reasons for the unfavourable contrast between earlier work and that of the present time, we should have to go deeper than a mere difficulty as to materials. In more than half of the thirty-seven illustrations to Mr. Nobbs' paper the architect may discern an architectural instinct, which is largely lacking in the work of to-day. Architects will, we are sure, be grateful to Mr. Nobbs for his able paper and its illustrations.

The Sculpture of Rheims Cathedral. Judging by the crowded audience which listened to the recent lecture at University College by Monsieur Paul Vitry on the sculpture of Rheims cathedral, there is a larger public than commonly supposed who appreciate such lectures. That an audience of so varied a character should listen with evident delight, for considerably over an hour, to a speaker in a foreign tongue, says as much for the vivid manner of Monsieur Vitry's lecture as for the interest of his matter. With dramatic realism he described first the mediæval craftsman and his work (differentiating between the archaic style of some of the statues, and the more contemporary style of others); then the tragedy which opened in September, 1914; and finally the efforts now being made to gather together and, in some cases, to restore the shattered remnants of the glory of Rheims. The lecture was admirably illustrated.

Mural and Poster Art. The recent developments which have improved so much the art of the poster, through the use of gay and flat colour and simple decorative design, have led to reactions in other directions, and this simpler and more elementary treatment so adapted to the ephemeral character of the poster is the logical direction of much of the work carried on now as an alternative to the old traditions of painting, which are somewhat discounted to-day. Yet this tradition of painting cannot be lost sight of, with its higher accomplishment and fulness of treatment, without great loss to art. We seem to denote in the present exponents of mural decoration a confusion between two things, and much of what they would attribute to the nature of mural painting applies more to the poster. It is not desirable that mural art should be confined within such limits, or that it should be supposed to depend on them. Crude and gay colour, flat tinting, &c., reach a result, but it is not the result we should look for in mural painting; but for an epic and exalted approach in which we see mastery in relation to great and enduring ideas.

Methods of Mural Painting. When it comes to examining the methods through which the mural decoration for the London County Hall was to be promoted, it will be seen that in spite of all the sentimental talk about "the art of mural decoration," these actual paintings were not mural at all. We quote the following from the letter of Mr. George S. C. Swinton (County Hall): "But the real trouble was that while in all probability these cartoons were designed and worked out in wide studios, these corridors in which they were shown—and rightly shown, because they would have to hang there—are only nine feet wide. We were too near them—hence these tears." Could condemnation be more complete? These paintings were a studio substitute executed under none of the conditions of mural art—which is done *in situ*—on the wall itself. The work not having been executed in the right situation could not but fail, and the astonishing thing is that such methods should have been adopted in order to promote mural art. Mr. Halsey Ricardo regrets that opportunity of encouraging young artists "at an extraordinarily cheap rate"—what a recommendation, coming from an artist!—should have been lost. It is felt by many artists that all the talk about "actual mural treatment" in the light of the facts is very ill-informed indeed. A great deal of mystery is made about it, but approached in the right way the walls themselves will yield up to the artist what he needs to know. How much experience of mural painting had Michelangelo when he started the Vatican Chapel? The theoretic approach which has governed the promoters of mural art leads them away from the facts, and enables them to believe in the advantage of fostering it "at an extraordinarily cheap rate," by employing students instead of experienced artists, and by doing the work in the wrong way.

GENERAL NEWS.

Concrete Houses for Bradford.

The Bradford Health Committee recently accepted a tender for the erection of 200 concrete houses at a cost of £418 per house. Acceptance of the tender followed the visit of a deputation to see concrete houses at Birmingham.

Zoning of London.

The Council of the London Chamber of Commerce has appointed a Special Committee with authority to communicate with the Ministry of Health and other bodies offering the Chamber's assistance in the various proposed schemes for town planning, which are being undertaken in London districts.

Esher Common.

Esher and Dittons Council decided recently to drop the idea of the promotion of an Improvement Bill to give them control of about 1,000 acres of common. The Bill would have given the Council power to establish a golf-course on Esher Common, but it has been strongly opposed by a ratepayers' meeting.

Tutankhamen at Wembley.

An exact reproduction of the tomb of Tutankhamen has been completed for the British Empire Exhibition at Wembley. It is the work of Mr. W. Aumonier, architectural sculptor, who evolved all the reproductions from photographs. The amount of gold leaf used in the reproduction cost about £1,000. The contents will be arranged at Wembley in exactly the same positions in which they were found at Luxor. The tomb has been dug out of the ground.

City Aldermanic Vacancy.

Mr. Josiah Gunton, F.R.I.B.A., is a candidate for the vacancy in the representation of the ward of Coleman-street on the Court of Aldermen, caused by the death of Sir John Bell.

Mr. Gunton has represented the ward on the Court of Common Council for over twenty years, and was Chief Commoner for the Court in 1922. He is a member of the Wheelwrights' Company, of which he was Master in 1909. He has practised as an architect in the ward for thirty-five years.

The Architect as Town-Planner.

Mr. H. V. Lanchester, F.R.I.B.A., recently delivered the third lecture of the Northern Architectural Association's session. Mr. W. T. Jones was in the chair.

In the course of his remarks he said town planning needed co-operative effort, and the question to be determined was the place of the architect in the group of technicians employed. The statement that town planning required co-operative effort among technicians of various types he regarded as in no way detracting from the position of the architect. He was far more likely to find his contribution of value if he were able to appreciate the points of view of the engineer and the sociologist. He would like to see the architect as the leading spirit of all adventures in civic planning and, given one with appropriate faculties, this might well be the case. The fuller his knowledge of the technique of town planning, the more likely he was to be able to justify the ideas he propagated.

In regard to the reorganization of our towns, Mr. Lanchester said most of our large towns would soon be demanding definite plans for the development of their central areas so as to provide suitable sites for public buildings and monuments. Our streets were susceptible of many improvements—shelters, kiosks, and the arrangement of lights would often lend themselves to better arrangement.

The easiest way to obtain recognition for their own views, he concluded, was to make it clear that they were able to comprehend the ground on which others formed theirs. Thus, general knowledge of the subject as a whole must be used as a basis in order to establish the importance of the position occupied by architects.

A Builder's Estate.

Alderman Charles Edward Doughty of Cornwall-gardens, Margate, builder, aged 72, left £43,825.

British Empire Exhibition.

In addition to the contract for the Australian Pavilion, the contract for the entire roofing of the Canadian Buildings at the Wembley Exhibition has been secured by the Ruberoid Co., Ltd., Lincoln House, 296-302, High Holborn, W.C.2, and represents a roof area of 12,000 square yards.

COMPETITION NEWS

Weybridge Hospital Competition.

The assessor, Mr. William A. Pite, F.R.I.B.A. has issued his award in this competition, and it has been adopted by the Committee :—

1. Messrs. A. W. Kenyon, F.R.I.B.A., and S. B. Livock, A.R.I.B.A., London.

2. Mr. Percy J. Westwood, A.R.I.B.A., 7, Adam-street, Adelphi, W.C.

3. Messrs. H. V. Lanchester, F.R.I.B.A., Lucas, F.R.I.B.A., and T. A. Lodge, A.R.I.B.A., London.

The design placed first is given in this issue.

Royal Masonic Institution School for Boys.

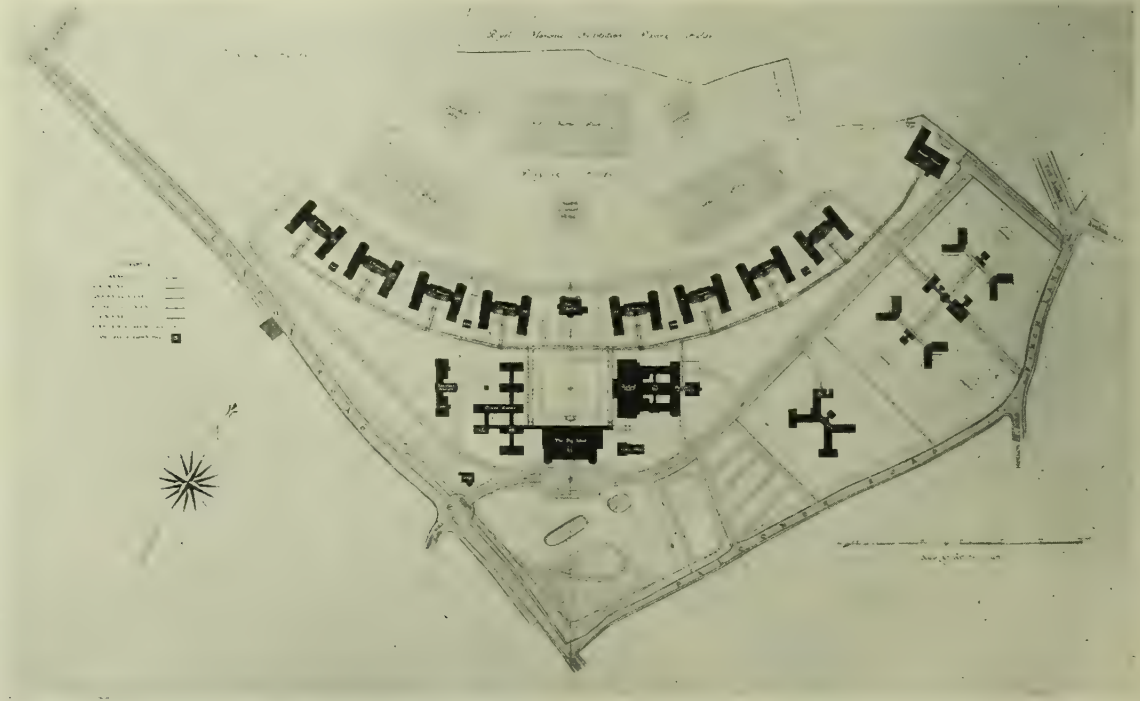
A review of the designs submitted in this competition is given on p. 291, and the design placed first, by Messrs. Davis & Emanuel and Mr. Henry C. Smart, is given in this issue.

Leicester Fire Station.

The assessors in this competition, Mr. Stockdale Harrison, F.R.I.B.A., and Mr. E. G. Mawbey, City Surveyor, have made the following award :—

1. (£100).—Mr. Trevor Sawday, A.R.I.B.A., 56, London-road, Leicester.

2. (£50).—Mr. Arthur J. Wood, A.R.I.B.A., Prestwold, Westfield-road, Leicester.



3. (£25).—Messrs. Moore and F. H. Morley, A.R.I.B.A., Leicester.

Masonic Peace Memorial.

For full particulars of this competition see our issue for February 8. No sending-in date has yet been fixed.

Other Competitions.

Other competitions still open include the following (the dates given are, first the sending-in date, and second the issue of *The Builder* in which full particulars were given) :—Essays on Heating and Ventilating (Mar. 31; Nov. 9, 1923). Industrial Designs (June; Dec. 21, 1923). National Theatre (April 26). Monument to Sir Wilfrid Laurier (April 3; Dec. 14, 1923). Belfast Union Lighting (March; Nov. 9, 1923). Dunfermline War Memorial (March 8; Dec. 28, 1923). Newcastle Concert Hall (March 1; Oct. 26, 1923). Ross-Smith Memorial (Sept. 30; Feb. 1). Newcastle Fire Station (March 27; Feb. 1).

Lay out Plan.

Royal Masonic Institution Junior School for Boys, Bushey, Competition.

Design Placed First; By Messrs. Davis & Emanuel and Henry C. Smart. (*See p.* 291.)

ROYAL MASONIC BOYS' SCHOOL, BUSHEY.

We illustrate this week the design placed first in the limited competition for a Boys' School for the Royal Masonic Institution at Bushey.

The winning design (D), by Messrs. Davis & Emanuel and Henry C. Smart, gives a good main frontage to the angle of London-road and Falconer-road; the big school is in the centre, flanked by classrooms on the left and dining hall block on the right. Behind the big school is a quadrangle 170 ft. square, and on the northern boundary of this the curved line of connecting corridors impinged fronting the bowed line of eight pairs of houses, with the headmaster's house in the centre commanding the playing-fields to the north. The existing gardens are retained at the angle of the site, and to the east are the infirmary, hospital, &c. The lay-out is simple and in many respects good. The elevations are in the main nicely balanced and have a touch of collegiate character. If we consider that the main consideration in a hospital should be the patient we might also think the boy should be the main concern in a boys' school. So we rather doubt whether it was best to place the urinals and lavatories at the south-end of the boys' houses and the gardens and ends of dayrooms and dormitories to the north. It would perhaps have been better to have the conveniences on the playing-fields' fronts, and the gardens to the south end of the houses, so that the sun might fairly penetrate the ends of the rooms and avoid having sanitary blocks to the south ends and so shutting out direct sunlight from dayrooms and dormitories. In the winning design these blocks appear to be two stories high if we regard the plans, but only one story high if we go by the elevation. The pen-and-ink perspective with this design was prepared by Mr. Sydney R. Jones.

The lay-out of (F), Messrs. Gotch & Saunders, has some similarity to design (D), but the blocks of houses run across the site east and west in one straight line, with the assembly hall in the centre. In front of the hall is a quadrangle with classrooms at the south side, and to the south of the quad is the dining-hall, and in front of that again the kitchen department, whilst north of that is the power-house, and right and left infirmary and sanatorium. The headmaster's house and the music school are left and right of the assembly hall, fronting the playing-fields. There is some pleasant elevational treatment, especially in the infectious diseases sanatorium and the assembly hall, the principal elevations of which would only be seen from the quad. There are no less than 34 sheets of well-executed drawings illustrating the design.

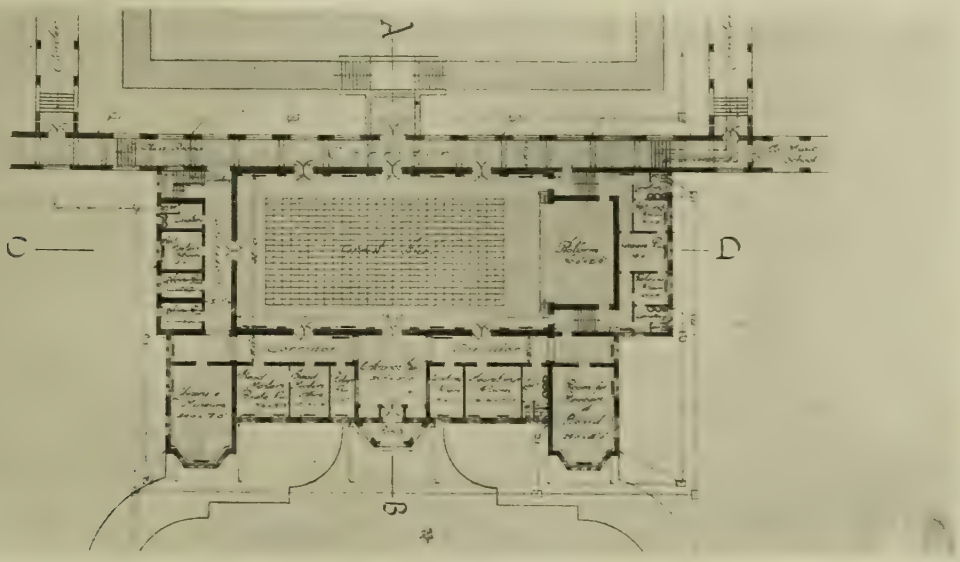
(B), by Mr. T. R. Milburn, is an Elizabethan design which, in its general impressiveness, with a good balance of parts, is quite good, and is shown in a pleasing bird's-eye. It has a good carriage approach from the angle of the roads, a lodge, and, forming one side of the quad to the south, a block of administrative offices. The headmaster's house is in the centre between the houses, looking over the playing-fields. Some of the house blocks are parallel to the front buildings at the south side of the master's house, and four more are parallel to the London and Falconer roads. There are only six sheets to the illustration of this design.

(G), by Mr. J. C. Dawson, has a very picturesque disposition of buildings, giving an agreeable main front centred by a tower. The houses are arranged around two courts (west and east) with polygonal sides. The treatment and proportion of the elevations are good, and the collegiate character of the work is very satisfactory. It is certainly an attractive design, and would result in many features of interest, with excellent architectural qualities.

(E), by Messrs. Brown & Barron, is a Tudor design of merit, and the big school is made a pleasant and outstanding feature in the grouping. The dining-hall is economically treated in the kitchen block. The headmaster's house is rather out of the way.

(A), by Mr. H. Percy Monckton, would have ranked better had he not crowded his buildings so closely together.

(C). Messrs. Buckland & Farmer have adopted a sort of Georgian type with some able treatment. One hardly likes the placing of the hospital blocks to the south at the roads' angle, though a good effect of the design would, however, be had from the playing-fields. The headmaster's house is in a good place for the occupier, but it was to have oversighted the playing-fields. No doubt masters and nurses prefer to have a corner isolated somewhat from the place in which they are continually working.



The following is the Assessor's report:—

"The seven designs submitted are exhibited by 580 drawings and 197 typewritten folios; and it has been necessary to study these closely, for though most of the designs have some excellent features, there is none that I can confidently recommend you to carry out as it stands in a satisfactory manner for less than a 10 per cent. addition to the £240,000 allowed. The competitors have evidently found difficulties in dealing with the site; in the large amount of accommodation required on the first floor of the boys' houses, as compared with that below, and, on combining adequate cross-ventilation in the kitchen department with a convenient and lavour-saving concentration. But it is evident that the limit of cost has been the chief difficulty, and has generally resulted in cramped dimensions, inferior construction or underpriced estimates. My examination of the designs has convinced me that the required accommodation in a convenient form, and in buildings of sound construction and materials, must involve a larger expenditure than £240,000. The design marked (D) though not a perfect solution of the problem set by the "Instructions and Conditions," approaches, in my opinion, more nearly to such a solution than any other. An injudicious desire to preserve the existing gardens has led the competitors to place the buildings farther down the hill than necessary, and you will probably desire a more permanent form of covered-way than a timber-framed one. But in other respects the arrangements are generally good, and in several departments are the best proposed. The specification of materials and construction are particularly full and satisfactory; my check of the estimate makes this one of the least costly designs, and the architectural character of the buildings is simple and pleasing without extravagance or superfluous ornamentation. Accordingly, I declare the design marked D to be the best. Design A is to be commended for an excellent internal arrangement of the boys' houses, (B) for the monumental character of the scheme, and (F) for beautiful drawing.

(Signed) Frank T. Baggally.

Royal Institute of Architects of Ireland.

At a recent meeting of the Council of the Royal Institute of the Architects of Ireland, a vote of condolence with the relatives of the late Mr. James Moore Caldwell Robinson, of Londonderry, was passed. It was resolved to take steps so as to arrange, if possible, for a conference on the subject of the shortage of skilled tradesmen in Ireland, which it is feared is likely to hamper developments. The following were declared elected members of the Institute: Messrs. Robert S. Barnes (Navan), Joseph J. Bruntz (Edenderry) and Frederick H. Jermyn (Dublin).

The Big School: Ground Floor Plan.

Royal Masonic Institution Junior School for Boys, Bushey, Competition.

Design Placed First: By Messrs. Davis & Emanuel and Henry C. Smart.

CORRESPONDENCE.

Doing or Talking.

Sir,—It is awfully good of the R.I.B.A. to think of giving Professor Lethaby a medal, and I'm sure Professor Lethaby will be delighted to have it, but I'm equally sure that both Professor Lethaby and all sensible members of the Institute would rather that the "old Lady of Conduit-street" did as he told them instead of giving him medals.

I suppose about two hundred years hence, when this civilisation has passed away, some member of an Art Committee or possibly of a Fine Arts Commission will wake up from his doze and say: "This man spoke the truth; this man was great and wonderful; let us go and write books about him; let us go and make speeches over his grave; let us lay wreaths on his tomb and thus show honour to the great——." But when, oh when, will Humanity obey the great—not in word but in deed?

W. W. Scott-Moncrieff.

Unification and Registration.

Sir,—The Defence League circular signed by Mr. Cross and Mr. Perks, with which members of the R.I.B.A. have been favoured, indicates clearly that the policy of this League is now definitely anti-registrationist, for reasons set out in the circular, as well as against any real reconciliation with the Society of Architects.

Every vote given for the League is, therefore, a vote given against registration.

Whatever the policy of the present Council may be, its members were certainly not elected by an overwhelming vote at the last election to give up in so half-hearted a manner the attempt to find a solution of this difficult problem and it is, therefore, to be hoped that members will wait until the proposals of the Council are announced before lending their support to such a retrograde movement as is foreshadowed in the Defence League circular.

Maurice E. Webb,
Hon. Secretary, 1922 Emergency Committee.

Sir,—I have received another circular letter from the R.I.B.A. Defence League. The points therein seem to me to lack the force and reason that a previous document anent registration possessed.

For instance, the fact that we have not a "public case," and are unable to put one before our Parliamentary agents on such a vital matter to the profession as registration, leads me to think we had better put an end to dissention and try to make the Institute an harmonious and live body, of real assistance to its members. Why should we trouble about such items as:—

(1) The temporary loss of dignity, because a few probably quite capable, but unqualified men, are admitted to its ranks.

(2) Considering whether it is consistent with professional etiquette to draw public attention by notice boards to the fact that plans of new buildings can be seen at an architect's office.

(3) Endeavouring to make its members dress up in gowns or pose as artists, when the majority are struggling professional men trying to make a bare living, some even as assistants.

Objects that are "purely defensive" do not lead to progress.

One of the few practical matters taken up by the R.I.B.A., which has led to good results for its members and the public, is the banning of unfair competitions, and this was the result of united action.

With regard to the need for registration or unification. In a suburban town, at a recent General Purposes Committee meeting, out of 47 sets of plans submitted for approval by the local authority, only eight sets were prepared by architects. In this same town there is a builder whose office windows are filled with drawings of "villas" and "bungalows" of questionable design, and who further offers to submit plans for intending clients, of whom, incidentally, he obtains a great many. These are facts which it is useless to dream over, or pass by.

Our Institute has long aimed to improve the public taste and raise the dignity of the profession, and it is not by its present methods or by public lectures that it will quickly and satisfactorily attain these ends, but by a scheme of registration or unification by Act of Parliament which will effectually prevent the present scandalous methods which are a disgrace to the architectural world. No building can be erected without consent of the local authorities; therefore, why not make it compulsory for all plans submitted to local authorities to be prepared by an architect qualified by Act of Parliament?

Times are changing, and a sane and vigorous policy is needed, otherwise the position of the architect will become worse instead of better.

A. Archer-Betham, A.R.I.B.A.

Sir,—Such an enormous number of professional classes allow preconceived political notions to formulate their estimate of any given political circumstances that it seems opportune to make a suggestion that although any given group of legislators may, in the accepted and possibly not accurate conception of their motive, appear to be adverse to the welfare of a given class or principle, they may in detail, so far from being so, represent a point of view quite dissimilar from any notion preconceived. The present Government is one very likely to encourage this preconception so far as the professional classes are concerned. I heard only recently a distinguished member of the clergy express a view which might lead us to suppose that the advent of a Labour or Socialist Ministry necessarily led to a submersion of intellectual interests to the material selfishness of one. It is not difficult to perceive that there exists in the present Government, whether we like it politically or not, elements more sympathetically inclined to the interests of our art than in preceding Governments, and having reached that conclusion we should be very foolish not to consider such a circumstance as one which should be carefully studied with a view to the opportunity it affords to establish the unselfish ideals which we have long cherished but until now have seen so little possibility of putting into practical form.

The suggestion, therefore, is, having circumstances of government favourable with liberty to give intelligent attention to the many just demands, whether we shall not immediately put forward our claims for proper recognition. The design of such important structures as theatres, public buildings generally, hospitals, homes for the working classes, and similar highly responsible undertakings are at least as important as the drawing of a tooth—a dentist can, by carelessness or incompetence, break the tooth or injure the jaw of one person at a time, but he is still recognised; an architect failing to make proper calculations for the structure of a stadium or theatre jeopardises or perhaps destroys the lives of scores or even hundreds of people by one mistake. It is fully obvious, therefore, to all but the intelligently blind, or singularly foolish, that it is of more importance for the public to have some guarantee of the competence of those whom it employs to design its structures than those who draw its teeth, and yet up to now this point of view has never been recognised by the State.

Now, therefore, that a chance presents itself of receiving the consideration of a new element in government, our profession should make an endeavour to have its claims for recognition considered at once, and it should ask the various Institutes and Societies representing the architectural profession if it is not a fitting time to endeavour to compromise their many, and in some cases trifling, differences with a view to having a Registration Bill considered during the life of the existing Parliament.

We do not know how long the present Ministry will remain in office—those of us whose political opinions are antagonistic to the Labour policy will, perhaps, wish it to be short—the aims of the present Cabinet are such that it is highly probable that as a new thing in governments its life may be short: that the same party will return again to office no thoughtful person can doubt, but still not one of us can tell how long once they have departed they may remain out of office. Surely, then, we should not miss what may be our greatest opportunity to gain recognition in this generation.

I would, therefore, like to suggest that it is a fitting time for the Institute and Society of Architects to settle their minor difficulties, and, in some cases, trivial disputes, and bring into sympathetic unison the other organisations affected with a view to submitting a Bill to this Government. The signs are that such a Bill would receive their support; there have been few such potential elements in any government before. We have to regard the matter not as members of any particular party, so far as politics are concerned, but as men wanting to see our work, and the public who trust it, properly safeguarded from the incompetent and unscrupulous. Do not let us allow any lethargy or any group prejudice arising from the differences between different bodies among us and comprising us, interfere with the accomplishment of this very great and very important object. It would be well if someone—best of all the Institute itself—set to work to formulate and set in motion machinery to accomplish this most desirable end in the shortest possible time.

H.

Sir,—Judging from a circular recently issued to all corporate members of the R.I.B.A., it appears as if the old quarrel between "ins" and "outs" is to be revived, upon crabbed points and petty issues. I am now becoming an old man, and rarely intervene, but trust you will allow me to point a way by which, perhaps, what all desire (registration, with such unification as would necessarily be involved), may be brought about with good feeling and general consent. There are strong opponents of either "Registration" or "Unification" taking precedence. The way of generous statesmanship appears to be that of concurrency.

The Society's Bill, as it stands, would certainly register all members of the Society, but it would wreck the Society. On the other hand, it would not need much altering to itself confer upon these gentlemen, as well as upon all others who, not being members of the R.I.B.A., could claim registration, the title of "Registered Architect" (or any other that might be agreed upon), and to bring all under Institute control. A little generosity here, in admitting at the time of passing of the measure a considerable number as Fellows, Associates or Licentiates (not under Charter, but under the Bill), would work wonders, and do only temporary harm.

Such a Bill, under the present Government—remembering that the Society's Bill as it stands was "settled" by a K.C. who now holds high office, and that its general principles are those with which trade unionists are bound to agree—would stand quite a good chance of passing. To say, as has been said, that there is no public case for it is sheer nonsense. The whole of the slum problem of the present time denotes the case! With properly trained architects, under whom alone habitable buildings would be allowed to be constructed, no such problem could have arisen. But the necessary powers could only be given to architects who were welded under registration into a body whose competence was recognised, and who could be dealt with if necessary—just as the issue of death certificates could scarcely have been permitted to medical practitioners before they secured registration. All our building by-laws, &c., are mere makeshifts for lack of such registration.

Statesmanship, generosity, and boldness, combined, perhaps, with a little mutual goodwill, alone are necessary—and also combined with promptitude and clear leadership from the right quarter—to secure that which we all desire, and for which I have personally been striving ever since my letter of February, 1884, just forty years ago. Croakings may be disregarded, for the whole outlook of Parliamnet has changed.

Kent. G. A. T. Middleton.

Does the Institute produce the Architect or the Architect the Institute?

Sir,—Members of the Royal Institute of British Architects, judging by correspondence received, are much concerned about "inclusion" and "exclusion" of those who are at present outside its circle.

The argument for "exclusion" is based mainly on these gentlemen's failure or omission to present themselves for examination. In the majority of cases these practitioners have passed the age for academical study, yet probably have a much more advanced knowledge than the student, who by passing the examination merely shows he has the minimum amount of general knowledge required before he should attempt to practise. This examination is of great value, for it sets a standard and produces a syllabus of subjects desirable for study. To pass the examination shows, at least, a student has set his mind upon the profession, but its value may be over-estimated.

The practise of architecture is of a peculiar nature. It depends upon a man's inherent gifts, or hereditary ability, much more than on academic training. It requires a power not to be acquired from books. The power to assimilate is especially necessary. Architects are assimilators, or they are not architects. One must assimilate the wants and requirements of any building to obtain fitness in design. Besides, there is no penalty that can be imposed upon one who has passed the examination, if he erects buildings devoid of architectural merit. If an architect who has not passed the examination proves he can produce a meritorious design, surely this is quite sufficient? It is urged by some, No—the man should be a man of culture and have had a liberal education. Can we demand so much? Is this demand made in any profession? It is ability that counts, and the examination can be no criterion or a sure testimony of the student's ability in the years to follow. It is necessary to stoop to rise, and if the Institute should, by inclusion, embrace all those of approved ability to practise within its circle, the Institute, like a balloon, will rise again and by its increased size be much more prominent than it is to-day. In fact, as before urged, the Institute should blend with kindred societies, then teach as well as examine; in short, aim at forming a Royal College of Architecture. By dropping individual interests all societies could combine and solidify—have one aim which would lift the Institute out of perpetual bickerings of a never-to-be-settled policy. With apology for my length.

Edward A. Jollye.

London.

Literature and Architecture.

Sir,—The comments made at the annual dinner of the Leeds Architectural Society suggested that no great writer had yet dealt successfully with architecture because of the lack of the requisite technical training. Is not Thomas Hardy (Hon. F.R.I.B.A. Inst. Medallist (Essays) 1862), and possibly the greatest of living English novelists, an exception? He was articled to an architect in Dorset when sixteen years of age, and later worked under Sir A. Blomfield in London. He did not finally abandon architecture until he was 34 years of age. Surely this has a certain clear significance?

In "Jude the Obscure" there occurs (after Jude had confessed he was sickened of ecclesiastical work) the following illuminating passage: "You ought to have learned Classic. Gothic is barbarian art, after all. Pugin was wrong, and Wren was right. Remember the interior of Christminster Cathedral. . . . Under the picturesqueness of those Norman details one can see the grotesque childishness of uncouth people trying to imitate the vanished Roman forms, remembered by dim tradition only."

Again, in describing Jude's first sight of the city of Christminster:

"The numberless architectural pages around him he read, naturally, less as an artist critic of their form than as an artisan and comrade of the dead handicraftsmen whose muscles had actually excited those forms. He examined the mouldings, stroked them as one who knew their beginning, said they were difficult or easy in the working, had taken little or much time, were trying to the arm, or convenient to the tool."

These examples, which are by no means isolated, surely show that in dealing with architecture Thomas Hardy has a depth of understanding, a knowledge of technique, and a charm of style which is unsurpassed.

By becoming saturated with his work one can possibly get some understanding of the meaning of architecture. After all, Ruskin being an obvious snare, there is perhaps no particular reason for his use by those who are fond of quoting a supposed safe authority.

London. L. P.

R.I.B.A. Housing Memo.

Sir,—Much interested by your "Note" on p. 248 of last week's issue, I turned eagerly to p. 267 hoping to find in the R.I.B.A. Memorandum a clear, constructive programme which would express the opinion of most practising architects, and so gratify your desire. But what is there in this very characteristic R.I.B.A. Memorandum to encourage the Government to take advantage of the offer of the Royal Institute to place the wide experience of its members at the disposal of H.M. Ministers?

The Royal Institute "are" of the opinion that "it is essential that architectural experience and practice should be employed to the fullest extent"; "and so say all of us."

The Memorandum points out (what it admits to be "generally recognised") that the difficulties are threefold; and it "make" observations on these three matters: Money—Materials—Men (the three M's). One looks in vain for anything new in the observations (the Royal Inst. "make"), and one fails to find any suggestion with regard to: (*a*) Methods of Finance to meet the special conditions; (*b*) How to break the Rings dealing in building material; (*c*) The course to adopt in order to obtain better output.

These are the things the Government wants to know, and upon which Ministers might reasonably expect the representative of 10,000 members of the architectural profession to enlighten them.

Like the difficulties of housing, the Memo. tells us that the activities of the building trade are threefold, and the provisions of dwellings appears to the Royal Institute to be the least of these.

I am afraid a very large number of the 10,000 practising architects really interested in housing will be disappointed by this effort of the R.I.B.A. Early in the "fifties" of last century the Council of the Institute issued an "Appeal," to-day it issues a "Memorandum." I wonder if it will ever act the part of a living member of a great community interested in real construction of ways and means as well as buildings!

John E. Yerbury.

The National Housing Problem.

Sir,—At the present time we are again confronted with the comprehensive and difficult problem of housing a large number of working-class people in sufficient and sanitary housing accommodation to promote a good standard of health and decency.

Apart from the question of financial assistance requisite to cope with the demands imposed by high building costs, we should not lose sight of the importance of producing beautiful, as well as inexpensive dwellings, of which our island home, "Britain Beautiful," is so worthy. If a satisfactory scheme for financial assistance can be arrived at by the Government, we venture to suggest that a little attention be paid to evolving a means of producing beautiful buildings at low cost.

In and prior to 1914 a great deal of consideration was given to this matter by many influential men, including our present Premier, Mr. Ramsay MacDonald, who zealously contended for, and had at heart, the preservation of the beauty of our countryside.

We hear suggested to-day, as a short cut to reducing building costs, the introduction of a patent system of concrete slabs. Admirable as this may be it is doubtful whether this system, if adopted on the ordinary common or garden "jerry-built housing scheme," will conduce towards beautiful building. The inauguration of a comprehensive architectural competition, either by the Government, or by some other highly influential administrative body, would, we feel sure, do much toward solving present difficulties.

Owing to the availability of certain materials in one district and their total or partial absence in another, the design submitted by the London suburban architect will not necessarily be of the same type as that designed by the provincial architect. It seems evident, therefore, that such a competition should embrace a large number of separate districts, and that one, two, or even three awards be made in respect of each district, at the discretion of the assessors. The winning designs should be those that conform most rigidly with the rules and conditions upon which the competition is founded, and those which combine at low cost, a judicially arranged plan, pleasing and artistic elevation, and a healthy home in point of ventilation and sanitation; built, as far as possible, from the materials at the immediate disposal of the local builder.

In the admirable organisation with the same aim as is now at issue, set up in 1914, but inadvertently indefinitely postponed owing to the outbreak of war, a number of landowners in each district agreed to build a certain number of houses from the winning designs for their local type. However, in these more advanced days of miraculous inventions, and in view of the comprehensive housing policy suggested by the new Government, is it not possible that, under the supervision of competent members of the profession, beautiful dwellings can be erected, under financial aid by the Government, to house the working classes under conditions that conduce to a higher standard of health, satisfaction, and decency?

In conclusion, it may be mentioned, as it has been many times before, that architectural amenity is the outcome of skill rather than of money, and that artistic dwellings can be erected under proper professional guidance, as well as can the "ugly and jerry-built types."

"Reader."

Trowbridge, Wilts.

Other Letters.

[Another letter is given on p. 304, and others are unavoidably held over.—Ed.]

Liverpool Hospital.

The proposed new Hospital for Women in Liverpool will cost, it is estimated, £100,000. It will take the place of the existing hospital in Shaw-street and the Samaritan Hospital in Upper Parliament-street. A site has been secured at the corner of Falkner-street and Bedford-street, and the intention is to erect there a modern building with accommodation for about 120 beds, equipped on modern lines, and ranking in all respects as a gynæcological institution with St. Mary's Hospital at Manchester.

A meeting of the Royal Institute of British Architects was held at Burlington House, W.1, on Monday last.

Obituary.

The Hon. Secretary (Mr. A. Keen) announced the death of Mr. Marshall Robinson, elected Associate in 1893. It was decided that a message of sympathy and condolence be conveyed to his relatives.

CHARING CROSS BRIDGE.

Mr. Paul Waterhouse, F.R.I.B.A., then read a paper, illustrated by lantern slides, on the proposed Charing Cross bridge.

In the course of his remarks he said so long as the present Charing Cross Bridge existed the Charing Cross Bridge question would never die. It happened, by an unexpected turn of events, that the revival by the promoter of the St. Paul's Bridge scheme, since the beginning of his preparations, gave very special point to their consideration of a project which had in every kind of way a prior claim to attention and to public interest.

The building of that bridge was possibly pardonable; for its retention there was no excuse, nor was there any parallel calamity in the river's history save one: the lamentable loss of old London Bridge. Speaking personally, he might say that there was only one bribe that would induce him to acquiesce in the continuance of Charing Cross Bridge. If by some wizardry they could give him back the pre-fire London Bridge with the houses on it, he would at that price reconcile himself to the prolonged existence of the unholy thing. Common sense would reply to this observation that he did not know the elementary facts of the practical problem at issue, and that one who could talk of the demolition of the ancient London Bridge as a calamity ignored the fact that the loss of the old bridge brought about the abolition of a most inconvenient obstruction to river traffic, the weir with which the construction of the bridge was incorporated. He had no wish to pursue this point, and as they could not have old London Bridge back he would not cry for the moon.

But, let it be said, it was not merely fools who had suggested that the water traffic problem would be partly improved—not hindered—by the re-establishment of a weir, or rather a modern barrage, at some chosen point below bridges.

From the general consideration of traffic problems, traffic being what it was to-day, he maintained that no useful public purpose was served by giving either the Continental visitor or the magnates of Surrey a means of central access which was denied to West Countrymen or Scots. Moreover, ignorance as to the value and centrality of Surrey land in the heart of London was rampant. One would think that the establishment of the L.C.C. palace on the Surrey shore would by now have had its effect on that ignorance. But no. Not yet. The effect, however, would come, and would come rapidly. Slowly but surely even those who officially placed Sir Reginald Blomfield's eagle, with its beak facing symbolically south, would learn that it was facing east, and would become convinced that Westminster Bridge was heading, not for the south coast, but for the City shores of the Thames. Bit by bit they would learn that a new and almost direct road of supreme importance in value would find its way along the line which was the bowstring of the Thames's bow from the Houses of Parliament to London Bridge. With that would come: (1) the acknowledgement of the value of Surrey land, which, one would suppose, even its owners, including the Duke of Cornwall, would like to encourage; (2) the sense of its available quality for first-class buildings of all kinds; (3) the desirability of planting the new Charing Cross station in a district which would give the station itself a chance of necessary expansion, coupled with extremely easy access to all parts of London—east, west, and central. They need not realise these facts if they preferred muddle to method, and if they persisted in their present policy of letting things happen without foreseeing them. He had always said that expense was no argument whatever against the discussion of these south-side, or rather Surrey-side, problems. Surrey was going to be developed as a part of London. Vast sums were going to be spent upon that development, and every penny of that expenditure was going to be interest-bearing. All that was needed—and this was a statement so elementary as scarcely to need utterance—was that some kind of official forethought should be given to the problem. Those who breathed of forethought were, it seemed, called dreamers, and were accused of ignoring the value of money.

It was merely because architecture, whether in house planning or in town planning, meant thinking before spending, that those who were interested in architecture insisted that in this matter of the Surrey future thought should precede expenditure.

This paper was not—it was true—on the subject of the Surrey side, but the Surrey side question must be brought into it, because there was no aspect of the bridge problem which was not either connected therewith, or likely to be precipitated, by those elements on the further shore which would act spontaneously and ungoverned if their outbreak was not controlled by forethought from the first.

Now what were the elements of the bridge problem? He thought they were five in number:—

1. The bridge must go because it was an abomination of ugliness standing commandingly in the spot which was London's great opportunity for beauty on a grand scale. When he used the word beauty he meant nothing more fantastic than the ordered arrangement of the useful according to traditional and recognised art.

2. A new bridge must take its place because one was needed at that point, not only for the foot traffic already existing, but also for the wheeled traffic which was ready to make immediate use of any new bridge at, or near that point, which would accommodate it.

3. The abolition of railway traffic across the river at that quarter would not only simplify the problem of making the new bridge a thing of beauty, but would release a large amount of Middlesex land which could be profitably and beautifully used for new streets and new buildings.

4. Incidentally, this would have a double effect in the relief of wheeled traffic, for the new roadway would be a remedy for a congestion of which the presence of a railway station was in itself a part cause.

5. The new bridge, besides being a compensation to the railway companies for the loss of their own powers of crossing the river, would be the means of providing for wheeled traffic a means of crossing from side to side, the present necessity for which was as nothing to that which the future—the comparatively early future—would demand.

Next came the questions: Where should that bridge start and where should it arrive?

They knew there were two schools of thought in this matter. There were advocates of the high level scheme—who might be described as those who proposed to utilise the fall of the ground towards the river on the Middlesex side so as, starting from some point twenty feet or more above the present embankment level, to allow the present Middlesex embankment road to pass beneath the new approach road. Some proposed that the Surrey embankment, if and when formed, should be similarly crossed by the Surrey approach road.

The low levellers were those who claimed that both embankments would be best served by having direct access to the new bridge.

In fact, the low-levellers' bridge would follow the example of Westminster Bridge, while the high levellers were on the Waterloo Bridge principle.

There were disadvantages, or rather difficulties, besetting each of these schemes as well as their great and obvious advantages.

The high-leveller must be very careful as to where he started his new road. Some said relieve the Strand by starting straight from the site of Charing Cross Station. But the Strand was rather fully burdened with its own troubles, and they had to make quite sure that the new road, while relieving with one hand, so to speak, did not, with the other, pour into the Strand at its worst point a burden of fresh influx too heavy to be borne. On this ground there was something to be said for starting higher up—at the level of St. Martin's Church and spanning both the Strand and the Embankment.

Again, the arrival on the Surrey shore needed thought. Unless it be decided to honour the new Charing Cross Station by making it the object at which the new bridge aimed, there was no great reason for insisting on a high level arrival on the Surrey shore.

First among the schemes in a place of honour he would put that of Sir Aston Webb and Sir Reginald Blomfield. It was a notable high-level scheme, and bore the imprimatur of Mr. John Burns. For magnificence the scheme of the late Mr. Adrian Berrington (illustrated in *The Builder*) took a high place. Mr. Carõe, a low-leveller, put a semi-circular "place" between the two stations, Waterloo and New Charing Cross. Professor Adshead, a high-leveller, had a scheme full of dignity. Mr. Barrett, again a high-level man, broke new ground by making Coventry-street his point-de-départ. Mr. Lucas's two schemes were on high-level lines.

Mr. Barclay Niven put, he knew, a great deal of thought into his low-level project. He was very conscientiously in favour of the embankment to embankment journey, and the lecturer was satisfied he gave to the question of levels and gradients a very careful study.

Others were the schemes of Sir Hamo Thornicroft, the sculptor (a project to which their friend, Mr. E. T. Hall, devoted deep interest), and some plans prepared by Mr. Nesbitt Kemp. He had also received, through the kindness of Mr. John Murray, slides relating to his own scheme.

In thinking out some questions connected with the development of the Surrey side, he adopted Mr. Niven's bridge as an assumed low-level scheme, and he exhibited his plan in relation to possible Surrey roads. Incidentally he showed a suggested position for the new Charing Cross, which he adopted because, though placed on the South-Eastern and Chatham system, it fell in with his view as to the general arrangement of terminal stations, which was that they should not only all be at a respectful distance from the centre of London but reasonably distant from one another—thus avoiding the congestion of road traffic which would result from allowing the streams leading to one station to unite with, or conflict with, those leading to and from another. This, by the way, was his great objection to putting Waterloo and the new Charing Cross cheek-by-jowl.

It would be noticed that on two of his own plans he had indicated St. Paul's Bridge. Heaven forbid that he should thus be sus-

pected of encouraging its birth! The fact was that at the time when he made these plans the little stranger seemed likely to arrive, and he was determined to see whether, if the event did take place, some arrangement could not be made whereby its very doubtful utility in Middlesex could not be compensated for by a life of comparative usefulness on the Surrey shore. He had hoped to speak of it as an hypothesis only, but recent tidings made them fear that the advocates and paymasters of the St. Paul's Bridge project were in full cry. It would be a calamity were money to be poured out on an unwanted enterprise when the needs they were now pressing so urgently needed satisfaction.

The difficulties of the low-level school were also difficulties of level. Assuming, not an wholly necessary assumption, that the gradients of the new bridge must not be steeper than those of Westminster Bridge, and assuming also, as he believed they must, that the clear-way of the central arches must be as high above high-water level as the central arches of the latter bridge, they were faced with the necessity—if an easy gradient was essential—of quitting the embankment on the Middlesex shore at the level 25 or higher. This meant that if the end of Northumberland-avenue were adopted as the springing-off point they had to raise the embankment road by from 7 to 10 ft. This, he believed, could be done.

For various reasons he hesitated to come forward with a definite proposal, but he confessed that it had lately occurred to him that the high-versus-low-level controversy might conceivably be solved by a combination of the two, such as would be produced by a central bridge way at the level of, say, O.D. 44, with a roadway on each side of it running from embankment to embankment, and only touching the 44 level at a point over the central arch.

There were many objections which could be immediately levelled against such a notion. The first was that whatever level was adopted as the revised embankment level there would necessarily be a fairly stiff gradient up and down from embankment to embankment. To this he replied that the bridge, having optional routes, no vehicle was compelled to cross at a gradient which its horse or its gear-box found inconveniently exhausting.

But give a motorist on the Middlesex embankment the option of attempting a gradient of 1 in 15 or going round by Westminster or Blackfriars, and he felt sure that he would dash up the slope of the new bridge.

As to width, 100 ft. had been by most designers assumed as the proper dimensions for the new over-river roadway, on the ground (*a*) that width added to dignity, (*b*) that it eased traffic. He wondered if either of these assumptions were reasonable. Personally, he believed that the narrower a bridge was, in reason, the finer it was in effect, and as to the second argument he believed experience was against its universal application.

What stopped most traffic was a right-handed crossing with a policeman; second to this came road repair. What was the road in London that conveyed the least obstructed, or swiftest traffic? The highway from Charing Cross to Victoria, otherwise the Mall. How wide was the Mall? Sixty-six feet. But that was not the whole story. Sir Aston Webb, in token of the gratitude of Englishmen to a late monarch, placed an admiral's palace at the eastern end, which, for all its beauty and dignity, was none the less a perforated obstacle.

Did it hinder traffic? Not a bit. It would scarcely be believed that the fair way available for approach to the 66-ft. roadway had a bare aggregate of 30 ft. There were, of course, three archways, all three standing open. The middle one was 21 ft. wide, the two side ones 18 ft. each. Few, if any, vehicles made use of the centre arch. It existed, as the child said, "in case of the King." So it happened that all day long motors were buzzing contentedly through openings no bigger than the short side of a billiard room.

What was more, he took the trouble to track the traffic a few weeks ago, when there was a white frost, and found that as far as the vehicles were concerned the road would have satisfied them if it had been one long billiard room all the way from King George V to King Charles I.

Thus, far from suggesting a bridge 300 ft. in width for the triple road, he would venture on 50 ft. for the high level causeway and 50 or even 40 for each side (low level) road, making it understood that on the Westminster side all traffic should proceed only from Surrey to Middlesex; Middlesex to Surrey vehicles being confined to the Blackfriars flank of the bridge.

In conclusion, he would summarise his remarks by reiterating:—

(1) That C.C.B.M.G. (Charing Cross Bridge must go).

(2) That the position of Charing Cross Station was neither logically nor rationally fixed where it was.

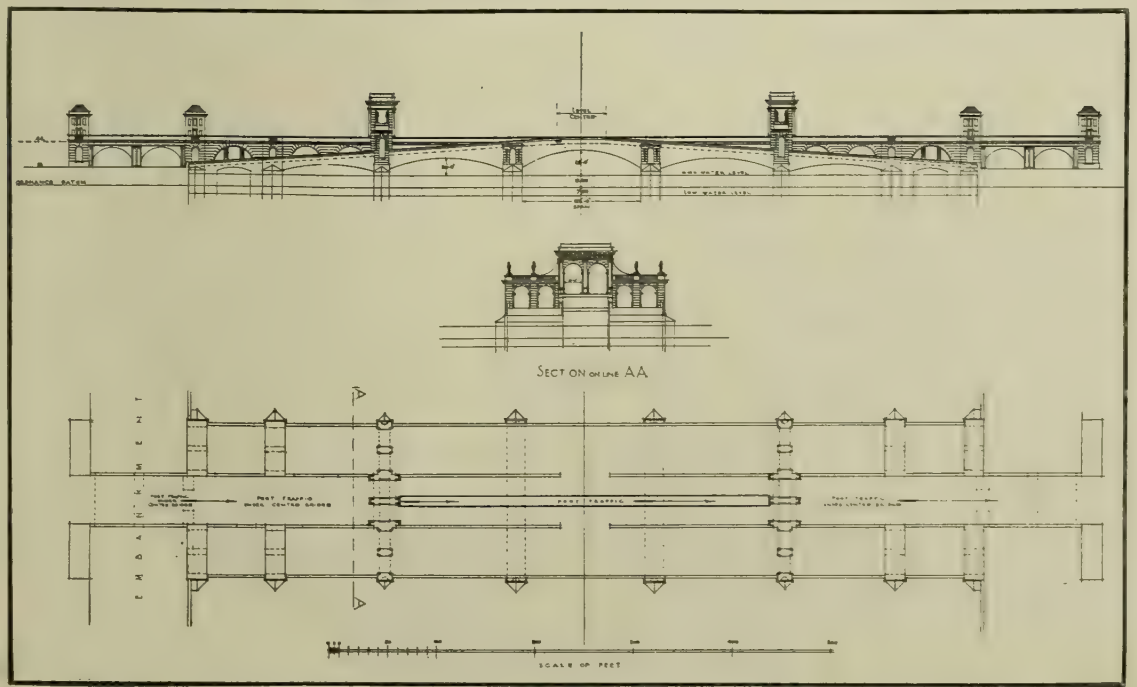
(3) That traffic needs demanded even now a roadway at this point or near it.

(4) That they would demand it infinitely more as the near future approached.

(5) That the dispute between high-levellers and low-levellers was or might be capable of solution by combination; and

(6) Finally, that money spent upon this bridge would be no bombastic expenditure on luxury but a stately measure of economy, part, in fact, of that considered development of the Surrey-side to which there was no alternative but the desperate and terribly probable course of leaving the Surrey side problem to chance and (coupled with this *laissez-aller*) some lavish expenditure on an at present unwanted bridge at St. Paul's.

Discussion.



Sir Henry Kimber, Bart., in moving a vote of thanks to the lecturer, said the paper was of intense interest, and showed there was a possibility of doing good to the community on both sides of the river worthy of the consideration of the best brains of the country. The question of a bridge across the Thames was fraught with great difficulties, especially on the Middlesex side. There did not seem, in his opinion, to be any settled conviction on the part of those who favoured a bridge in the vicinity of Charing Cross as to the nature of the bridge or where it had to go.

Sir Bannister Fletcher, said he was an enthusiastic supporter of a bridge at Charing Cross—whether a one, two, or three-decker. He hoped the L.C.C. would reinstate the possibility of a Charing Cross scheme. He was much opposed to St. Paul's Bridge.

Mr. Maurice Hulbert said the removal of the present railway bridge at Charing Cross was not within the sphere of practical politics. The idea must be dismissed for a number of years. Because it was ugly it was not practical politics to say take it away. Architects were living up to their reputation of being not practical men but dreamers.

Captain G. S. C. Swinton said in regard to the question of the L.C.C. being pledged to spend money on the proposed St. Paul's Bridge, no such pledge had been given. The Council's purse had got a bottom to it, and they were already committed to re-building Lambeth Bridge at a cost of £100,000.

Mr. John Murray, F.R.I.B.A., said he considered the question was threefold—traffic, financial and æsthetic. The two chief, perhaps, traffic and æsthetic, were dependent on the financial capital required.

Suggested Combined High and Low Level Bridge at Charing Cross. By Mr. Paul Waterhouse.

WEYBRIDGE COTTAGE HOSPITAL COMPETITION.

The designs recently submitted in this competition are now on view at Vigo House, Church-street, Weybridge, and Mr. William A. Pite, F.R.I.B.A., the assessor, has made his award as follows:—First premium, Messrs. Kenyon & Livock; second premium, Mr. Percy J. Westwood; third premium, Messrs. Lanchester, Lucas & Lodge.

We are able to illustrate this week the winning scheme, which we understand has been adopted by the Committee. From an examination of the seven designs submitted we consider the selection a very happy one.

The conditions required that a hospital of 36 beds should be provided, preferably in a single story building, on a site which appears to have presented many difficulties to the majority of the competitors, but which in the direct plan of Messrs. Kenyon & Livock seem to have vanished. The site is certainly a peculiar one both from its shape, aspect and the limited access obtainable only from the southern end in Church-street. It is surrounded by a high brick wall which, in our judgment, should be lowered on the southern and western sides. The accommodation required comprises wards for men and women, each containing 12 beds, a children's ward of 6 cots, and 6 private wards; further, the conditions stipulated that consideration should be given to the possibility of extension in the near future.

An unusual but interesting feature of the scheme is the electrical and radio-therapeutical department, which is at present carried on in Vigo House now occupying the front portion of the site. Much excellent work has been done here, and an extensive connection has been formed, especially among private paying patients of the district. This section, to be incorporated in the hospital, will form a very important branch, and its inclusion has to a considerable extent governed the planning and general lay-out of the proposals.

One of the most difficult of the many problems connected with the hospital design is the skilful preservation of a true architectural composition not interfered with by the varied technical requirements, which are of greater necessity in this than most other kinds of building.

The authors of the winning design are to be congratulated upon the production of a very charming little proposal, which should result in the acquisition of a small but very complete hospital and a model of its kind. The plan is skilfully arranged with wards slightly radiating towards the south, having correct orientation, a measure which is fundamental and essential in securing the full benefits of sunshine for the patients. The plan is a simple and economical one, compact and with the services well arranged for ready and convenient access. The elevation and general treatment of the buildings are of an unusually high standard, well suited to this type of building. The plans show the general proposals. The electro-therapeutic department is placed in the centre on the north side of the corridor, and is planned as a complete self-contained unit which can, if required, be closed at night without in any way interfering with the Hospital. The wards are well planned, but we do not care for these being merged into the building in such a way as to preclude complete cross-ventilation to some of the beds. The clerestory windows shown at the north end of the wards would no doubt be blocked by further extensions over, and at no time would prove entirely efficient. The duty rooms are too small, and in other parts of the plan we notice apartments of miniature dimensions. The walls are generally drawn about half the thickness required, but we observe this is corrected in the report. We can safely assume that such defects as mentioned will disappear in the study and development of working plans.

Future extension to the hospital is provided for at the first floor level, and this will involve the nurses' home becoming sandwiched between the two upper ward units. It is not clear how additional accommodation for the nurses and maids can be secured as will be found necessary to meet demands of the future bed extensions. The kitchen department is well arranged, perhaps a little small in some respects. The nurses' sitting-room is not quite well placed for outlook or aspect. The operation theatre unit is shown disconnected as it should be, and appears to be thoroughly well considered and worked out in detail.

The scheme No. 4, placed second, is that submitted by Mr. Percy J. Westwood, and indicates a simple hospital plan with excellent ward units without some of the defects of the winning scheme. The electro-therapeutic department is planned as a distinct unit away from the hospital, but connected by a covered way. On the site of the present Vigo House is placed the nurses' home, having a small casualty section beneath on the ground floor, with an out-patients' department and matron's office. The latter seems to be somewhat out of touch with the hospital in such a position. We consider it a mistake to allow the corridor which passes through the electrical department to become a traffic way. The operation theatre plan is inadequate, also the kitchen and stores are very limited. The pay wards with northern aspect would have to be reconsidered, and as in the other plans no special sanitary provision seems to be made for these rooms. The author of this design is certainly to be commended in having maintained adequate air space around the wards in striking contrast to many of the crowded designs submitted.

The design (No. 2), submitted by Messrs. Lanchester, Lucas & Lodge, is illustrated by a very complete set of drawings, and shows the main portion of the site to be well covered by an extensive group of buildings, apparently a more expensive scheme than the other premiated sets. The authors have in this instance assumed that a back access road can be obtained which, if unattainable, means that all stores would have to perambulate the site. The details of the planning are good, the wards being correctly orientated, but in the case of the male ward the sanitary annexes are placed at the southern end, so obstructing valuable sunshine and air from the beds. This arrangement also prevents a proper and direct connection between the private wards and the sink room, etc. The theatre is well planned, also the kitchen and dining-rooms, and the electrical department provided with its own special entrance. A well-arranged nurses' home is placed on the first floor over the principal entrance, this being the only instance where we noticed that adequate provision had been made for possible extension of the Home.

The interpretation of the problem set forth by the remaining four competitors indicates the usual diversity of views as to the detailed requirements of modern hospital planning. From a general survey of these we get the impression that the authors have failed to grasp the salient points of the problem. Hospital planning seems so easily to become a complex thing, and in striking contrast with such the winning design illustrates excellently the required simplicity and directness of plan which are essential to the correct solution of the problem.

Design No. 5 shows a small administrative unit placed on the site of Vigo House, containing the matron's office and sitting-room, committee room, etc., with the nurses' home over and the maids' bedroom on the second floor. The main hospital building is placed on the open portion of the site, with wards thrown out on the northern side with the consequent lack of winter sunshine which would be intercepted by the connecting block containing the pay wards, etc. Intervening between the main building and the administration block are the electro-therapeutic and X-ray departments, through the centre of which passes the main connecting corridor. In order that women and children may reach the electrical department it would be necessary for them to pass through what is virtually a portion of the men's ward.

No. 7.—The best part of the site in this scheme is occupied by the administration section and the electro-therapeutic department, the wards being relegated to a position next the boundary on the north-east side; the isolated children's wards are no better treated by being given a site on the north side with the high boundary wall on one side and the operation theatre on the other.

No. 6 possesses a most attractive elevation, but with many defects in plan. The whole of the main buildings are placed on the open portion of the site with the main entrance gates well arranged in the centre of a symmetrical grouping formed by the porter's lodge and the mortuary block. The principal hospital entrance is placed in the centre of a long building (200 ft.), which practically occupies the full length of the site on the west side, and parallel with the ward units. This entrance appears to be a common one for all departments, with the exception of the casualty, but with an unfortunate arrangement of kitchen service immediately off a bay of the entrance hall. Four of the pay wards are placed off the main corridor leading from the entrance to the main ward unit with northern aspect, and on the opposite side is situated the children's ward; the entire service to these can only be through the principal corridor, which we consider to be a most unsatisfactory plan to adopt.

No. 3 is planned to occupy the greater portion of the site at the rear, and consists of a symmetrical grouping of buildings, the axis of the wards running north-east to south-west, with the administration block with kitchen service and dining-rooms in the centre. The children's ward is grouped with the women's as suggested by the conditions, but the sanitary annexe serving both these units can only be reached by the main corridor, giving access to the operation theatre. Timber roofs are shown over the wards, these would have to be removed to enable extensions to be carried out, and so expose the wards beneath to damage by weather.

MEETINGS.

Friday, *February* 22.

Glasgow Architectural Craftsmen's Society.—Mr. W. J. Smith on "Ancient Egyptian Architecture Details." At Royal Technical College. 7.45 p.m.

Junior Institution of Engineers.—Mr. J. S. Marshall on "Ciment Fondu." At 39, Victoria-street, S.W.1. 7.30 p.m.

Saturday, *February* 23.

Royal Institute of British Architects.—Visit to Derby House.

Tuesday, *February* 26.

Builders' Clerks' Benevolent Institution.—Annual General Meeting. At 48, Bedford-square, W.C.1.

Wednesday, *February* 27.

L.C.C. Central School of Arts and Crafts.—Sir Banister Fletcher on "Roman Architecture." At Southampton-row, W.C.1. 6 p.m.

Leeds and West Yorkshire Architectural Society.—Lecture by Mr. H. T. Buckland. At Leeds Philosophical Hall, Park-row. 7.30 p.m.

Institute of Builders.—Dinner. At Hotel Victoria, Charing Cross. 7 p.m.

Thursday, *February* 28.

Incorporated Institute of British Decorators.—Mr. A. Orr on "A Tour in Spain." At Painters' Hall, E.C. 7.30 p.m.

A PROPOSAL TO STIMULATE DESIGN.

By J. HEMBROW.

THERE is little which flourishes in this world and improves faster than the slow pace which evolution provides, unless it is encouraged and fostered. At present there is only the highest award for the idealist in design; I mean the consciousness of work well done, and in our world—the world of architecture—it is not enough; it is leaving too much to nature—particularly to good nature.

Although some of us have criticised the R.I.B.A. harshly for its lethargy, I certainly think that the Royal Institute of British Architects has given a great fillip to design in London by their medal for the best building design in the year from an architectural point of view. Furthermore, I think this idea should be extended; and that its extension would result in very great benefit. Design in London needs stimulus, but it is also vital elsewhere in our land, and I venture the following suggestion for the encouragement of design in the little group of not unimportant islands in which we live and labour.

Could not each of the allied societies be responsible for making a yearly selection of the most beautiful building in its area? A jury of suitable judges could be formed, and each year members of the profession, and others, if desired, could be invited to send photographs of a building, either their own or someone else's, in their district (whether the architect of a selected building is a qualified man or not should not disqualify his work). The building having been selected, a bronze medal could be given—these medals being struck from a design prepared and authorised by the Royal Institute. London being the capital and much larger, might follow the same proceeding, but should carry a silver medal, the honour being greater. The photographs of the buildings chosen by the allied societies and London should then be forwarded to the Institute, and a committee formed of two architects, one a town-planner, an artist, a sculptor, and a distinguished dilettante, could select one from them and, after a visit, if required, the author of the most beautiful building erected in the British Isles in the year should receive a gold medal. This scheme would not entail any prohibitive expense. I am sure it would stimulate design in the profession, and further, would attract public interest. This latter would be, perhaps, added to if the "medal" building or buildings were exhibited at the Royal Academy each year.

Such a brief outline as this cannot, of course, cover all the details. I foresee certain difficulties in the composition of the committee in districts where the men most competent to adjudicate are also most likely to deserve the award; but I think by an exchange of nominees between neighbouring societies such troubles could be dealt with. Any town, I am sure, would be proud of having one of its buildings dubbed the most beautiful of the year, and I cannot see but that it would greatly stimulate public interest in architecture; nor can I see any element of the undesirable in the publicity it would invite.

[**** We think the suggestion is an excellent one, which we hope will be sympathetically considered by all concerned.—ED.]

R.I.B.A. MINUTES.

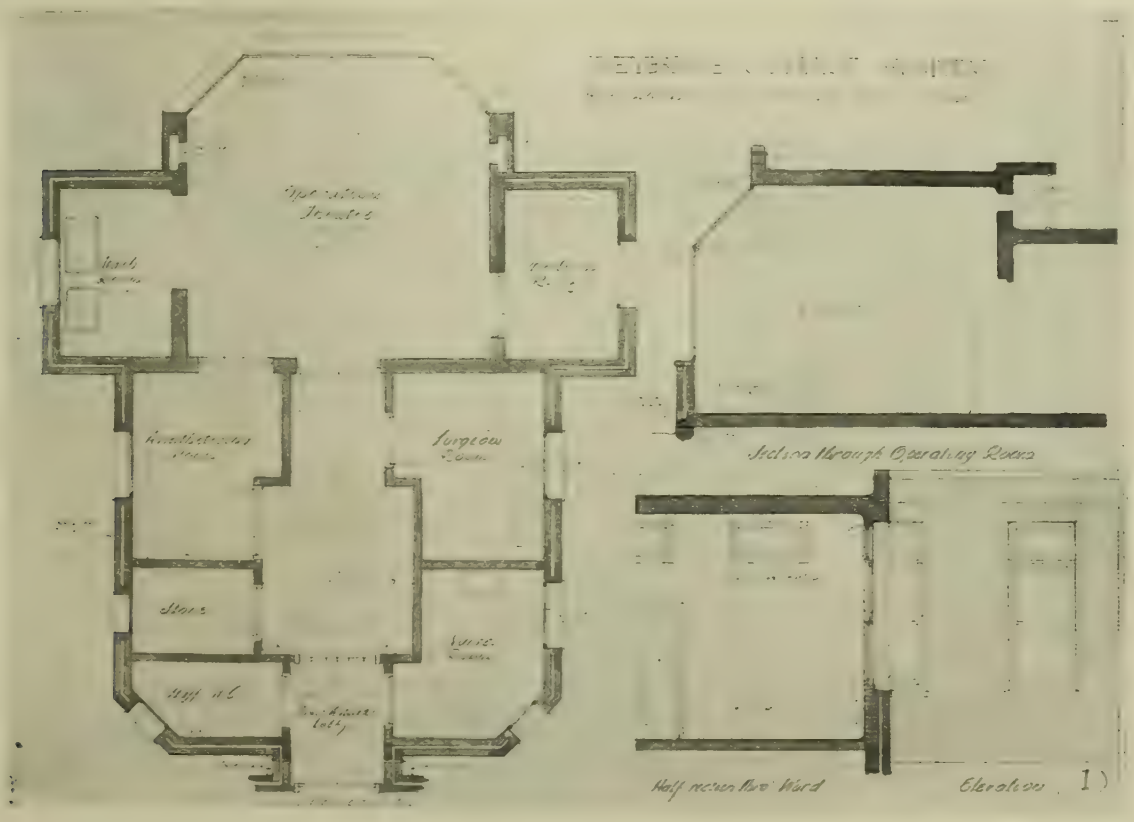
WE take the following notes from the Minutes of the Council meeting held on February 4:—

ROYAL GOLD MEDAL, 1924.—By a unanimous vote it was decided to nominate Mr. W. R. Lethaby as a suitable recipient of the Royal Gold Medal for the year 1924.

NATIONAL HOUSING POLICY.—On the recommendation of the Housing Committee a memorandum on the subject of National Housing Policy was approved and ordered to be sent to the Minister of Health and communicated to the Press.

ARTERIAL ROADS.—On the recommendation of the Town Planning Committee a memorandum was approved for submission to the Minister of Transport.

ST. PAUL'S BRIDGE AND CHARING CROSS BRIDGE.—It was decided to invite the Royal Academy, the London Society, the Architecture Club and the Town Planning Institute to appoint representatives to attend a Conference to discuss the present position and to take any public action that might seem desirable.



INTERNATIONAL CEMENT CONGRESS.—Mr. H. D. Searles-Wood and Mr. C. Stanley Peach were appointed to represent the R.I.B.A. at the meetings of the International Cement Congress in April.

TRIBUNAL OF APPEAL (LONDON BUILDING ACTS).—Mr. John Slater was re-appointed to represent the R.I.B.A. on the Tribunal of Appeal.

RETIRED FELLOWSHIP.—Mr. F. O. Lechmere-Oertel and Mr. Arthur Edmund Street were transferred to the Class of Retired Fellows.

Eighteenth-Century Architecture.

Mr. J. A. Gotch, President of the Royal Institute of British Architects, recently lectured on this subject at a meeting of the Glasgow Institute of Architects. In the course of his remarks he said the eighteenth century saw the development of the great movement in art which began in the early years of the sixteenth. When man had once made up his mind that the masterpieces of Italy were the only examples to be followed nothing but time and determination alone were wanted to produce in all the lands of Europe a general sameness of appearance and treatment. If they were to seek inspiration from the work of the eighteenth century they would find it in two directions—first, in the grand schemes of house and garden combined, and in the general grandeur of treatment bestowed upon the great houses of the time; second, in the sober and simple houses where the plainness of the general appearance was sometimes unexpectedly broken by the curious treatment of a door or chimney and where the joiner's work was full of homely lessons.

Royal Masonic Institution Junior Boys' School at Bushey.

The accepted design in this limited competition is by Messrs. Davis & Emanuel and Henry C. Smart. The buildings have been planned on the high ground, the axis of the plan taking a north-westerly direction from the highest portion of ground at the junction of London-road and Falconer-road.

The central feature of the scheme is a large quadrangle with cloisters around it, having the big school and entrance on the south, the class rooms on the west, the dining room block on the east, and the boys' houses on the north side spreading east and west on a curved front, following to some extent the contours of the ground, the head master's house being placed on the axis. The whole of the boys' houses and head master's residence overlook the playing fields. The entrance is from London-road opposite Merry Hill-road.

The whole of the foregoing buildings are connected by covered ways or cloisters, beneath which is placed the main subway for pipes, &c., thus giving a direct run from the power house for heating, hot water and electric mains, &c., with branch subways north and south to feed the several buildings. The infirmary and sanatorium are placed well away from the houses and schools, but sufficiently near the kitchen department to be served by it.

The materials proposed are Luton facing bricks with red brick dressings and quoins and red tile rustications. The small quantity of stone used would be Portland. The roofs would be covered with sand-faced Broseley tiles.

A review of the designs submitted appears on p. 291.

Weybridge Hospital Competition.

The design of Messrs. Kenyon and Livock was placed first in the recent competition for a hospital at Weybridge. A review of the designs submitted is given on p. 296.

PROPOSED ST. PAUL'S BRIDGE.

In a letter to *The Times* on February 15, Mr. Mervyn Macartney, Surveyor to St. Paul's Cathedral, states:

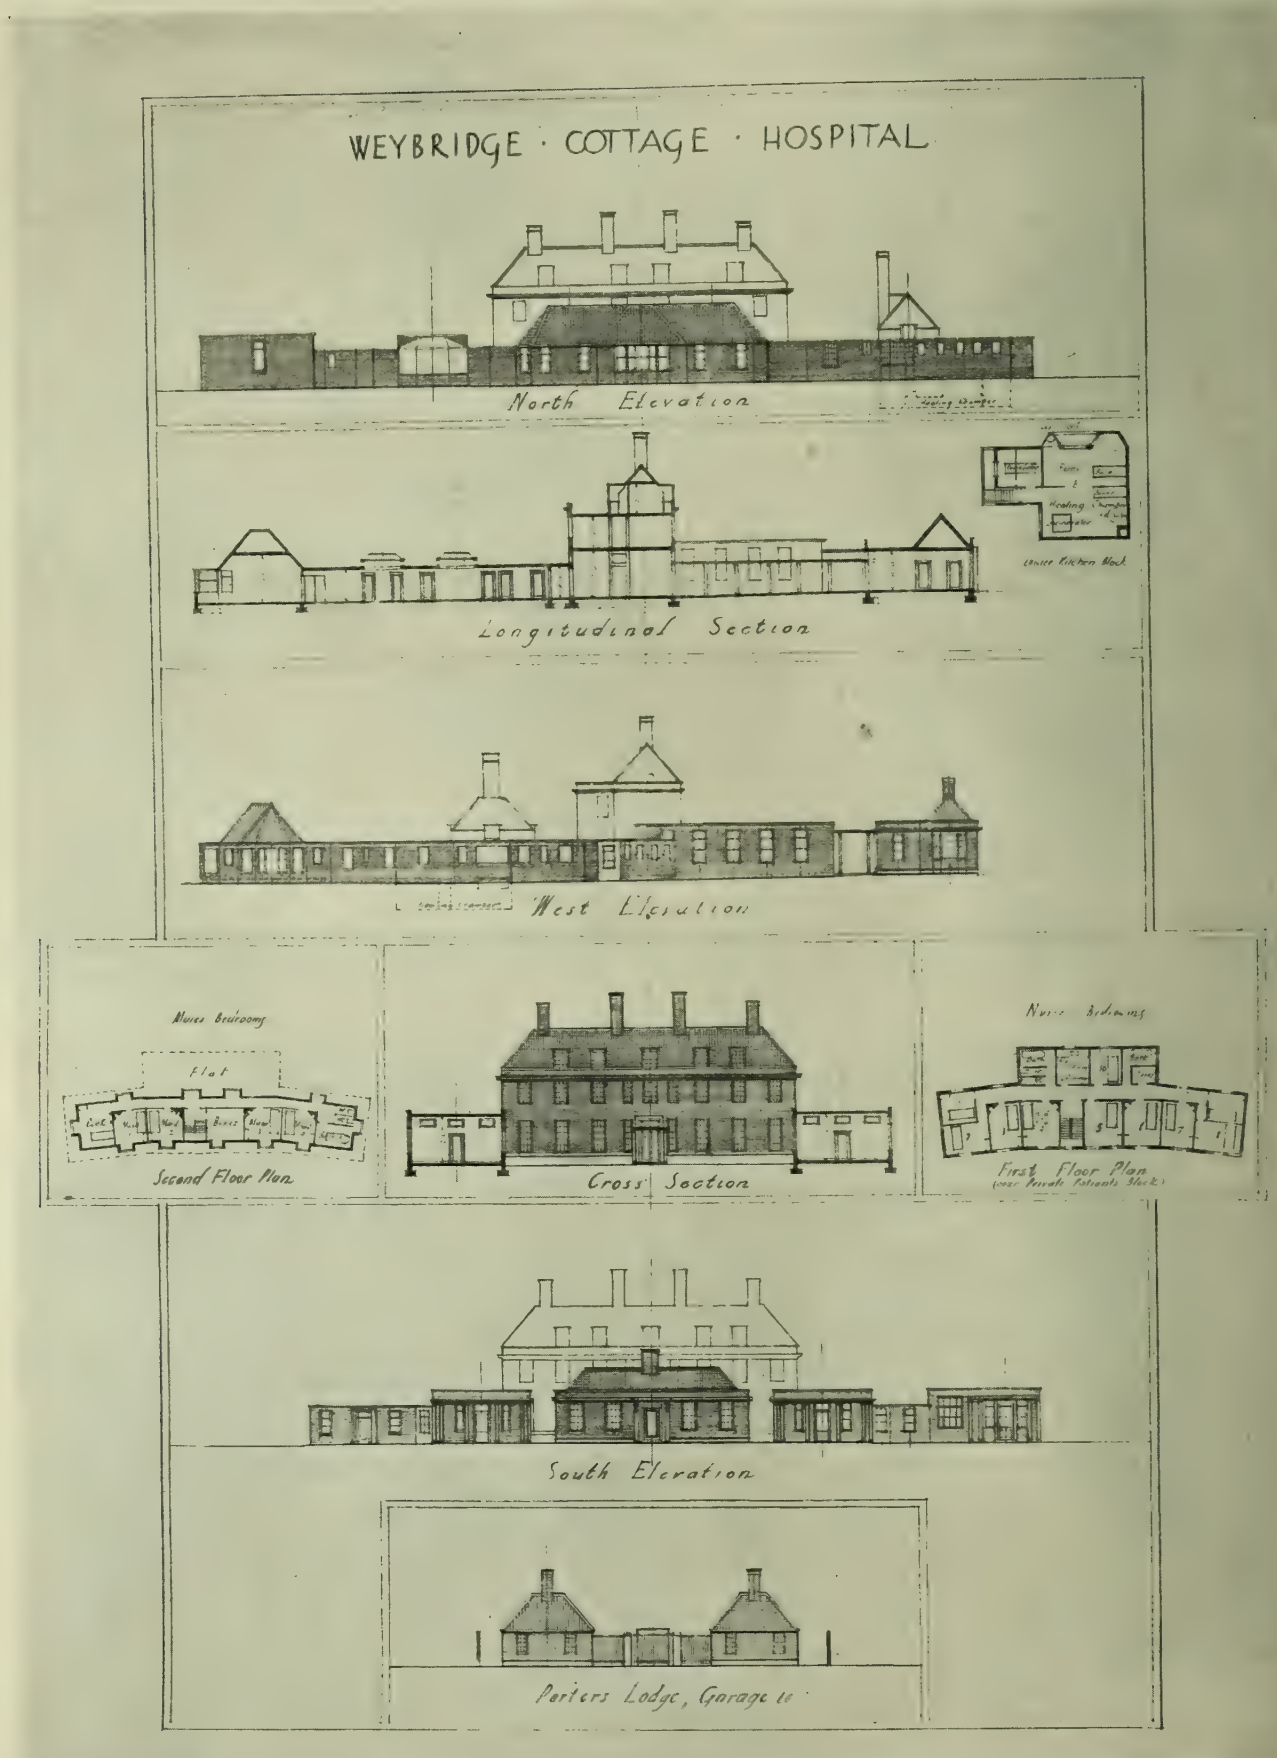
"As the architectural adviser of the Dean and Chapter of St. Paul's Cathedral, I feel bound to protest against the carrying out of the St. Paul's Bridge scheme, which will shortly come before the Court of Common Council, even more forcibly now than I did 13 years ago.

"In the intervening years I have learnt more of the construction of the Cathedral with the result that I am more alarmed at its state than I was in 1910. There is visible evidence of recent movement in the two nave piers. There was an inquiry held about 1910 into vibration, but neither the consulting engineer at the time nor I was satisfied with the result of that inquiry, and since then the speed, weight, and amount of vehicular traffic has increased enormously. The vibration of the chain supporting the chandelier in the Chapel of St. Michael and St. George is quite perceptible. The introduction of the six-wheeled omnibus will certainly add to the seriousness of the menace. But the chief danger lies in the weakness of construction of the building. The foundations are but 5 ft. below the crypt floor level, and lie on a stratum of pot earth, also about 5 ft. thick, under which there is sand and gravel for 18 ft. 6 in. till the London clay is reached, the last six to eight feet being saturated with water. The level of this water is 26 ft. above datum at the G.P.O. The level of Queen Victoria-street, where it will pass under the new bridge, is 28 ft. above datum. I confess that I view the sinking of abutments for arches into this water-bearing strata with the greatest apprehension.

"The Chapter have an agreement made in 1911 with the Corporation which gives them some control over the construction of the northern approaches, but I doubt if, in view of present knowledge, this protection is adequate.

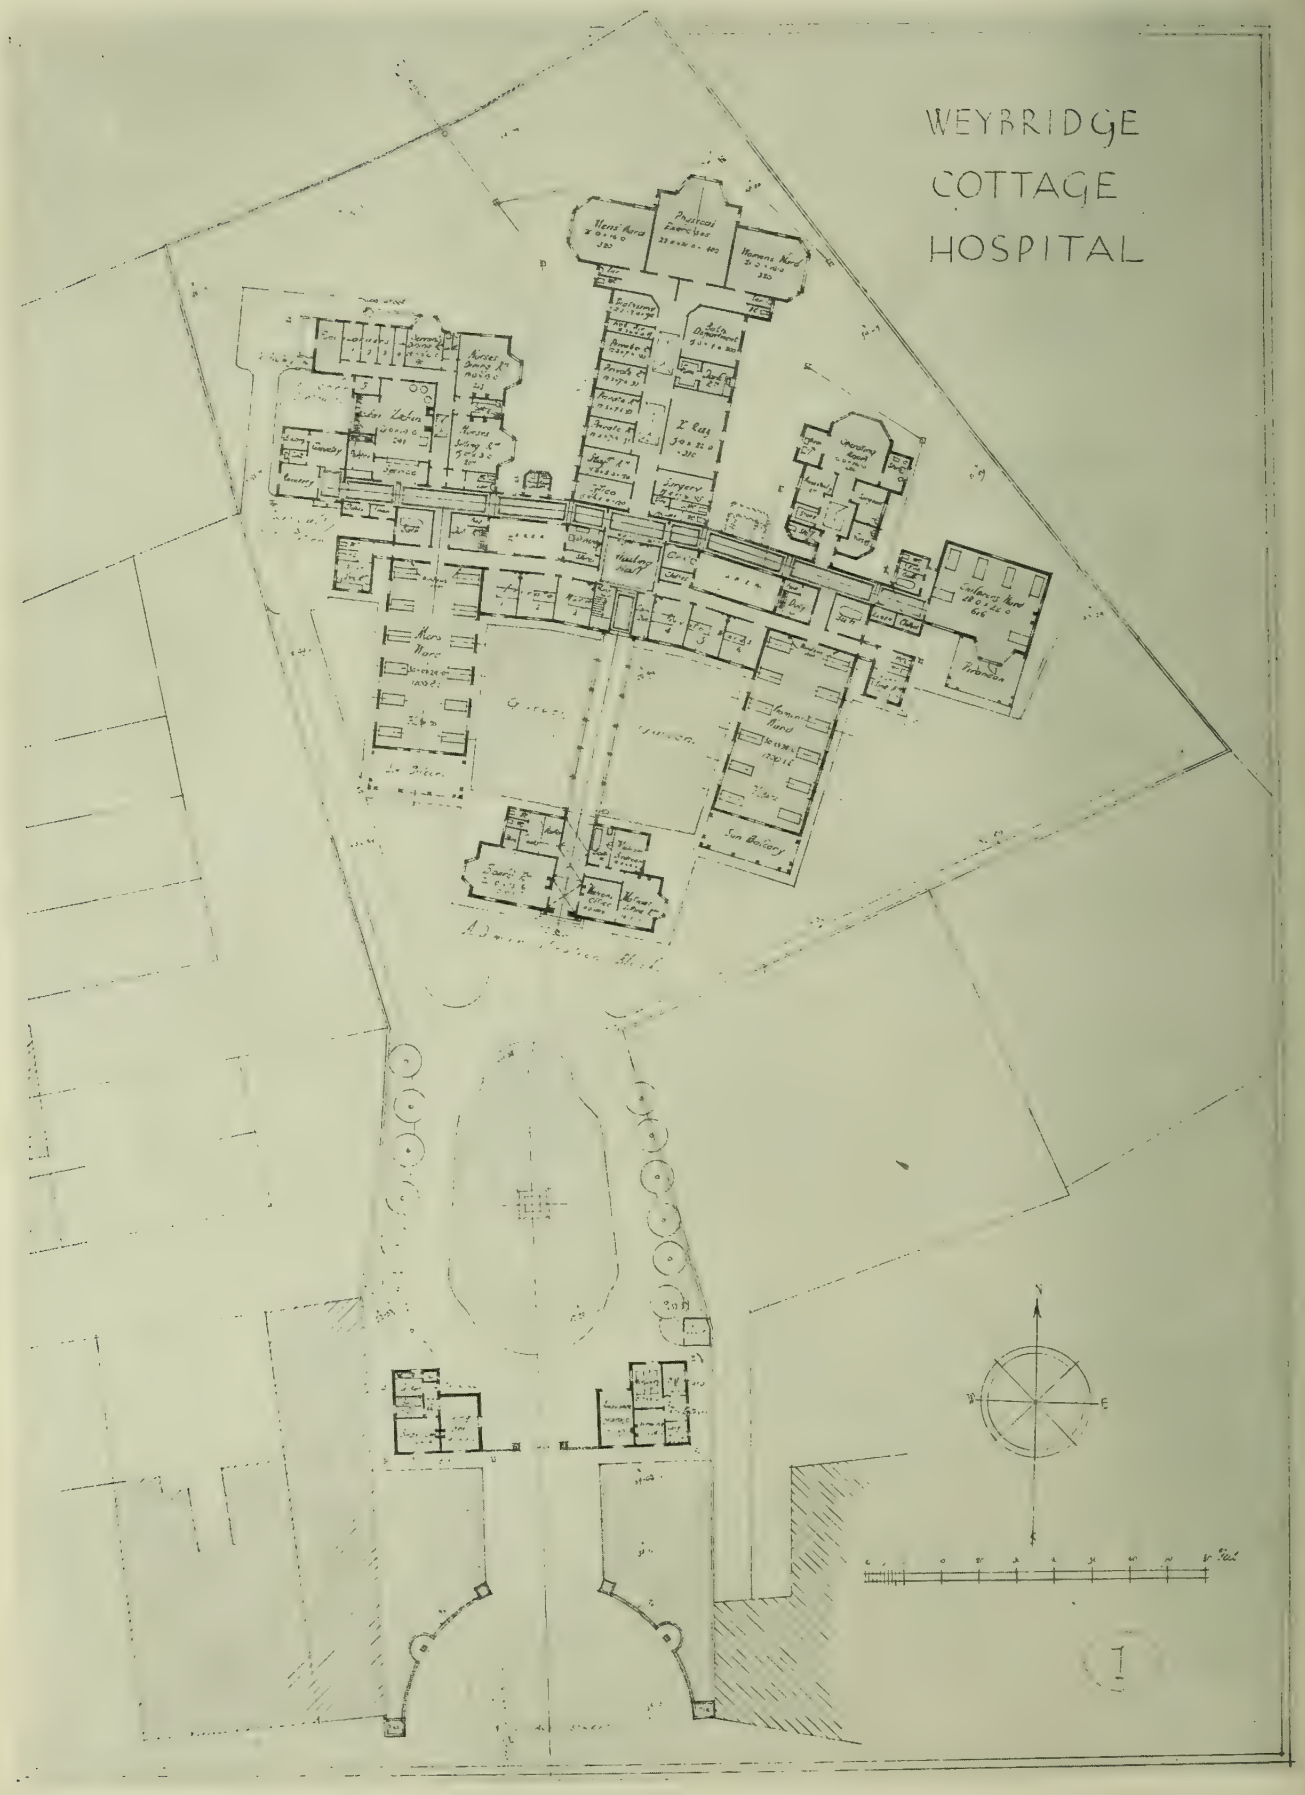
"If Mr. Basil Mott, the engineer of this scheme, will assure the Dean and Chapter that there will be no risk whatever, his opinion will, of course, be received with respect, but it must be remembered that Mr. Mott designed the bridge before he had the opportunity of examining the Cathedral, and also that as a member of the Commission on the fabric he signed the Interim Report of June, 1922, from which the following extract is taken:—

"'It would be an exceedingly formidable task to attempt to strengthen the foundations and, in our opinion, it is not necessary, provided always that no building or other operations are carried out below the level of these foundations in the neighbourhood of the Cathedral.



"This report is signed by two other eminent engineers, Mr. G. W. Humphreys, Chief Engineer, London County Council, and Mr. E. C. Trench, Chief Engineer of the London Midland and Scottish Railway.

"The whole position is one to cause anxiety, and the Chapter, while not desirous of offering factious opposition, naturally feel that no risk can be taken."



Suggestion for an Approach to Charing Cross from Waterloo.

THE EXEMPTION OF NEW HOUSES FROM RATING.

By MAJOR HARRY BARNES.

The nature of this proposal can only be understood by a consideration of the purpose of rating. The purpose is to determine the amount which certain individuals in a definite area are to contribute in order to make up a total sum which is required to cover the cost of Local Administration within that area.

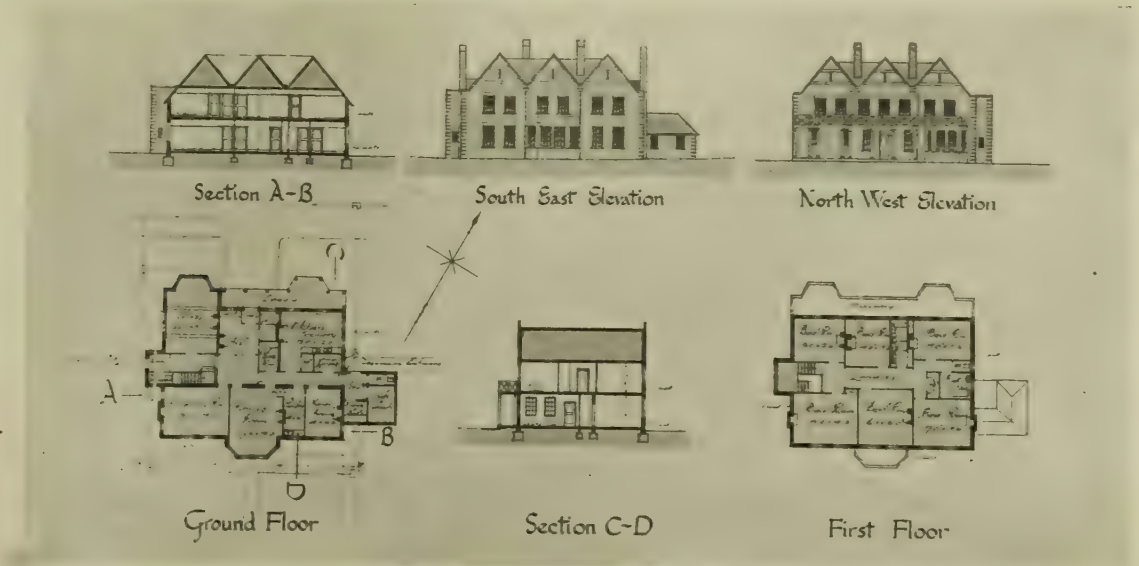
The first effect of all exemptions from rating is to relieve a number of individuals from the whole or part of the amount they would otherwise contribute towards the total sum required. The next effect is to increase the amount which the remaining individuals must contribute in order to make up the total sum required.

It has been decided that the individuals within the area who are to make the contributions are the individuals who exclusively and beneficially occupy land and buildings. Where the buildings contain machinery it has been decided that the benefit they derive is to take into account any enhancement of the value of the premises by reason of the presence of the machinery.

There are at the present time a certain number of exemptions and relief granted to certain individuals occupying certain specified classes of land and buildings—for instance, the occupier of agricultural land receives a relief of 75 per cent. from what he would otherwise pay; and railway companies and others pay only one-quarter of the general district rate on certain portions of their premises. It is also being urged that occupiers of premises containing machinery should be relieved of the enhancement in value at present contributed by the presence of the machinery.

All the reliefs and exemptions granted to these individuals, of course, increase the contribution which the remaining individuals must take, and that fact is, in the main, the reason for opposition to the relief granted under the Agricultural Rates Act and also to the opposition to the exemption of machinery from rating. It is now suggested that the individuals who occupy new houses of a certain class should be exempted for a period of twenty years or more from making any contribution to the costs of Local Administration or are only to be required to make a diminished contribution. This, of course, would again increase the contribution to be made by the remaining ratepayers. No estimate appears to have been made as to the increased burden which would fall upon the ratepayers who do not secure this exemption.

While some people advocate the entire exemption of contribution of this class of person, others would limit the exemption and would determine the contribution they should make by ascertaining the increased cost of administration due to the erection of these new houses and apportioning it between the individuals occupying them. It is hardly necessary to point out that this would be a very difficult and complicated process. Apart from the question of producing new houses there would appear to be nothing to commend the proposal.



It is true the income tax limit exempts certain individuals whose incomes are below the statutory limit from making any contribution in the form of direct taxation to imperial expenditure, and there would be logic in the contention that persons with an income below a certain figure should be relieved from contributions to local expenditure; but that result is, of course, not secured by the proposals which exempt new houses from rating, as it might very well be that the persons occupying the new houses would be in a better position to contribute towards local expenditure than many of the persons occupying the old houses not exempt from rating.

The proposal, it would seem, therefore, does not rest upon any grounds of equity as between ratepayer and ratepayer, but is put forward solely and entirely as a means of securing the erection of new houses. The argument is this: that if an individual is released from the necessity of making a contribution towards local expenditure, he can apply the relief so granted towards the payment of additional rent, and the additional payment which he is thereby enabled to make will bring the rent he is able to pay up to the economic level required to induce the production of new houses.

On this it may be said it is of course clear that to relieve any person of one part of his expenditure will enable him to increase his expenditure on another part, and the same argument which is being used as a ground for relieving these people of local taxation would have equal force in a plea that they should be relieved from imperial taxation, or from contributions to health and unemployment insurance, or, to put it to an extreme, if it were agreed that all persons living in new houses should be entitled to be exempted from taxation of all forms and, in addition, to be supplied with rations, they would undoubtedly be put in a position to pay a much higher rent than would otherwise be the case. Freed from all the fallacies by which the argument is surrounded, it must be clear that the proposal to exempt people who occupy new houses from making a contribution to local expenditure is, in effect, nothing more or less than to subsidise them at the expense of other ratepayers in order to enable them to pay a higher rent.

However, assuming that to be admitted, it might still be urged that the necessity for getting new houses is so great that it is worth doing, even at the cost of a subsidy of this character, and that, as in fact a subsidy of some kind or other must be given, and all subsidies must be at the expense of the ratepayers or taxpayers, it is immaterial the form which the subsidy takes, whether directly given as a grant or by a remission of local taxation over a certain number of years.

On that it may be said that the present form of open grant, the amount of which is ascertained and known, is one in which the division of the payment of the grant is

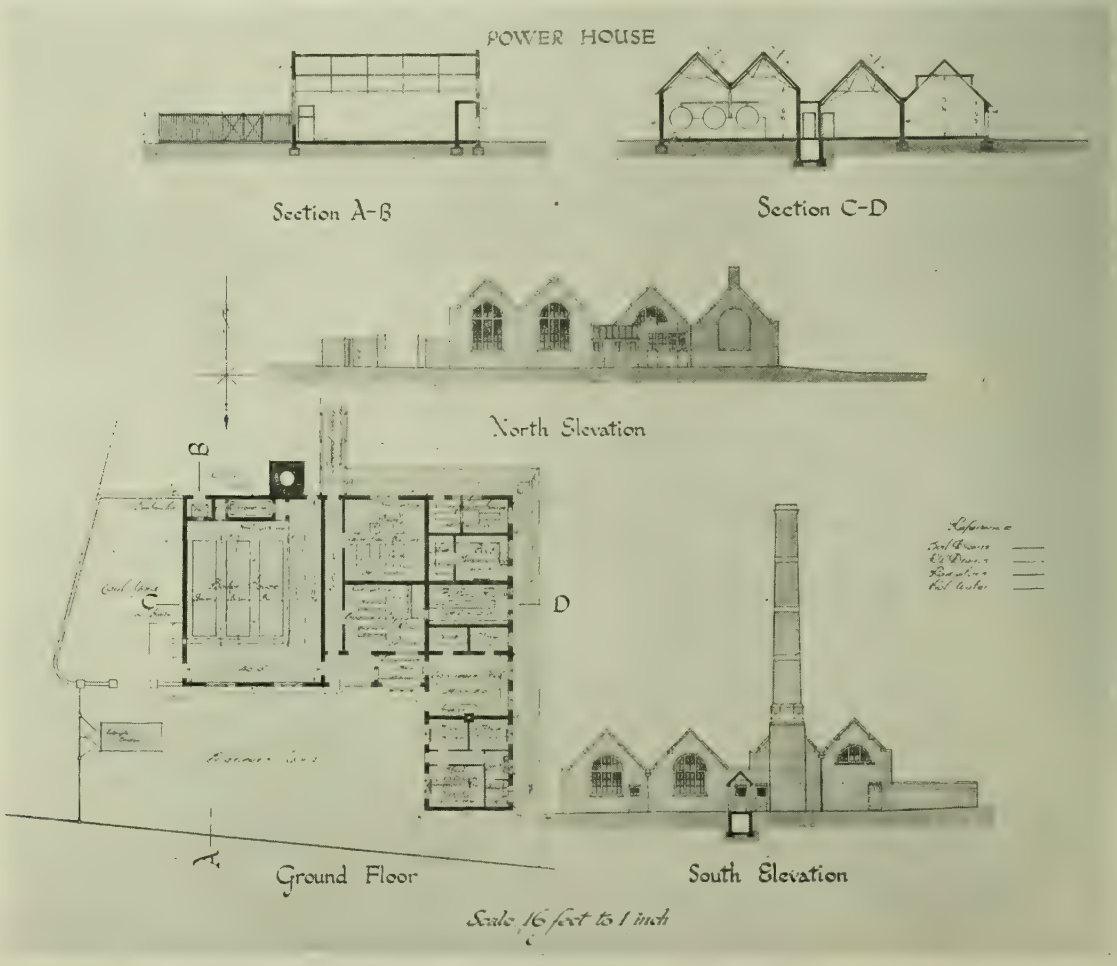
Royal Masonic Institution School for Boys Competition; Headmaster's House.

Design Placed First: By Messrs. Davis & Emanuel and Henry C. Smart.

clearly shown as between the central and local authorities. It is a loss, an admitted loss, which is equally divided between the two, and it is further a loss which is arrived at after taking into account the contribution towards local expenditure which, under existing conditions, the occupier of such houses would make.

The idea in the minds of those who push the proposal for the exemption of such houses from rating is (as I have already shown with regard to houses in private ownership) that the exemption will enable higher rents to be paid. With regard to houses in municipal ownership, the idea is that if these houses are relieved from contributions to local expenditure, the loss will be diminished, and i tmay be eliminated.

That is true as far as municipal book-keeping is concerned, but as the effect of the exemption will be to reduce what would otherwise be the rateable value of the area, it must follow that in order to raise the sum required the poundage of rate must be increased, and therefore the effect of the elimination is to increase the burden on the remaining ratepayers, the whole of the loss falling on them. As under present arrangements the contribution of the Imperial Authority is a proportion of loss only, if no loss is shown there will be no grant from the Imperial Authority; to that extent, therefore, the effect will be that as to one-half of the loss the ratepayers will be damnified. Looked at from this angle, it is clearly seen that the proposal is one which would bring relief to the taxpayer at the expense of the ratepayer. From the point of view of those who regard housing as a local problem, that would be no objection; but those who believe that housing is a national service, the cost of which should not wholly fall upon the localities, will find in this fact a serious objection to the proposal.



However, on the assumption that all these considerations must be put aside as having no weight in the face of the necessity for the production of new houses, we come to the question as to whether this policy is likely to produce new houses.

Let us take the case, first, of municipally provided houses. Is it likely that municipalities will adopt a scheme which would throw the whole burden of loss upon their constituents, in substitution for the existing one under which half the loss is borne by the Imperial Government? This course does not appear to me to be in the least likely to be taken.

The other question is, whether houses are likely to be erected by unaided private enterprise on the security afforded by the remission of rates for a given period. It is conceivable that persons who are able to buy houses for their own occupation might be disposed to take the risk of paying a price for a house which can only be justified on the ground that the remission of local taxation will be continued for a definite period; but such owner-occupiers form a small portion only of those who will occupy such new houses, and the real question is whether the investor, the person who is considering whether to place his money in house-property or in some form of industrial securities or gilt-edged securities, would consider a legislative enactment remitting rates over a given period as giving sufficient security to induce him to pay a price for a property which would, apart from the legislative enactment, be more than the property was worth. This is seriously open to doubt. Such an enactment would produce a great amount of irritation as between the owners and occupiers of properties which were exempted, which resentment would be accentuated by every increase in the rate. Such a feeling would produce a sense of instability and insecurity at least tending continually to minimise the value of the exemption.

No surveyor would advise an investor to buy such property without discounting very heavily the advantages presumably offered by the Act. In other words, the rate remission would have to be considerably more than the actual amount required to bring the rent up to an economic rent standard.

To sum up, the proposal is one that in the first place is inequitable as between one section of ratepayers and another; in the second place it is inequitable as between the local authority and the central authority; and in the third place would either fail to produce the result desired, namely, the erection of new houses or only produce them at a greater cost than the present system of open grant.

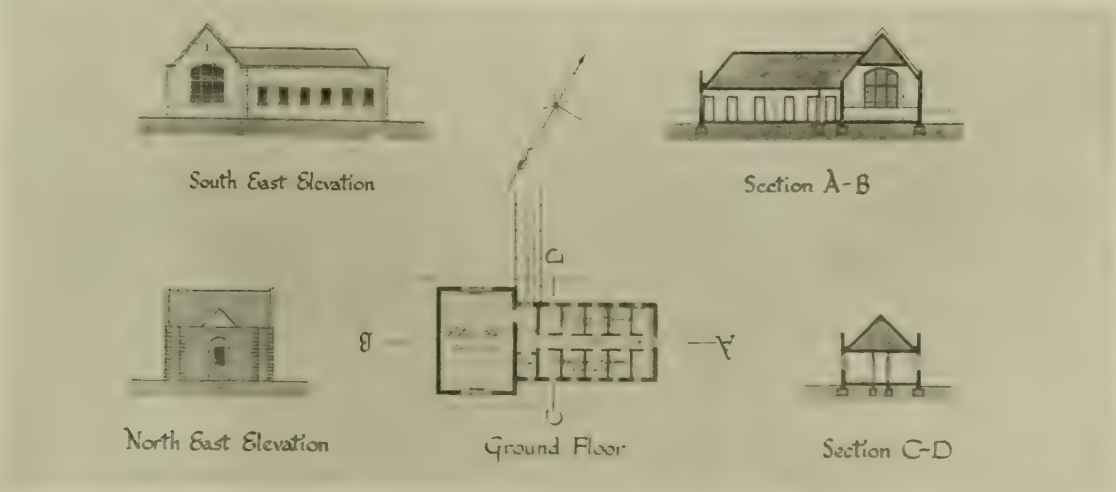
EXHIBITION NOTES

A HUNDRED YEARS OF ARCHITECTURAL DRAUGHTSMANSHIP.



The few examples of architectural draughtsmanship brought together by the Association could hardly be said to represent the best of what the last hundred years has produced in England, but they are interesting as showing diverse methods of representing designs, and judged from the varying standpoints of many would impress more or less favourably. We doubt whether any of the architects whose works are illustrated would feel that the quality of their designs was done full justice to, or that even they themselves could succeed where others fail. But that is no reason why we should not find some degree of pleasure and satisfaction in what has been done. We remember with what pleasure a certain well-known artist's pictures of architecture were received years ago in England, and many of us probably rate them higher than his vastly more ambitious drawings in recent years, but we cannot complain if the artist's maturer vision has given us pleasure of a different kind. To some artists there has been given the capacity for an individual expression, whilst to others an excellent quality of work has come by study of the work of others. Generally a quality of individuality provides the greater interest, but the evidence of an artist's pleasure in his work is an unfailing pleasure to others. We doubt if the joy in his earlier efforts is ever felt by the artist when he has allowed his outlook to be modified by acrid criticism, undue envy of others' methods, loss of belief in himself, and divided aims. How few of us fully realise that it is easier to lead than to drive? If we did we should find better men around us and be the better in ourselves. Great art has certainly thriven in spite of criticism and other hindrances, but generally art is a tender plant, and watered by kind and appreciative thought may be counted on to flourish. The strident and brilliant, and often slightly vulgar, drawings which illustrate architecture have their value (it may be great to architects and promoters), but we can at least be grateful for the essentially modern developments of architectural draughtsmanship, and do our best to encourage such a beautiful art.

Coming to the exhibits, names immediately arise in our mind which are not represented, such as the late H. W. Brewer, Axel Haig, Norman Shaw, R.A., and F. L. Griggs, A.R.A. The drawings are exhibited in chronological order and many of the draughtsmen and their work are probably unknown to the present-day student, though from them he can well profit, for if the so-called "slickness" is missing the sincerity is there. A. W. Pugin's "Rouen" drawings are pleasing and quiet in colouring, suggesting a desire for truth rather than assertive draughtsmanship. The late Mr. Phene Spiers' exhibit faithfully portrays an "Entrance Porch to the Chapter House, Beauvais," in pleasant and harmonious colour, broadly handled and devoid of tricks and mannerisms. The exhibit of Alfred Waterhouse, R.A., dated 1862, "Design for New Law Courts from the Embankment," is boldly handled, the relative values of buildings, foliage and surroundings being accurately judged and at no point of the drawing is any hesitancy or indecision apparent. Alfred Waterhouse exhibited regularly in the Painting and Architectural Galleries at the Royal Academy, and in each his work was of a high order. Sir Ernest George, R.A., is represented by a typical sunny example entitled "Welbeck Abbey, New Loggia and Central Bay." George Edmund Street, R.A.'s, work is shown by a bird's-eye view of the "New Courts of Justice," a good drawing, but it would be considered laboured by our present-day men; probably at the time it was made it was thought highly of. One must not lose sight of the fact that these men were practising architects of the day and not solely draughtsmen. The work of Chas. Gascoigne and Alick Horsnell are not the best specimens of their work; these two brilliant young men bid fair to gain an eminent position in their profession, had they been spared; both handled their work in a broad and bold manner. C. E. Mallows' work is well known to most of us; his work was always clean and direct; he had a large following and many admirers: some representative examples are on view. The brilliant work of A. E. Ricards is also well known; he is represented by a clean and direct drawing of an interior. Amongst those who are still with us mention may be made of Sir Reginald Blomfield, R.A., who shows some sympathetic pencil drawings; one, entitled "Point Hill from the Railway Bridge, Rye," is a drawing handled with much delicacy. Mr. Maurice B. Adams is represented by a drawing of Blicking Hall, dated 1869. Mr. T. Raffles Davison is well represented by drawings of the work of Sir Edwin Lutyens, R.A., in whose work he appears quite in sympathy. The fountain court, Deanery Garden, is full of sunlight, with all unnecessary detail eliminated, yet conveying to the mind a truthful representation; note the sunlight on the old lead cistern; it can only suggest a drawing made on the spot. "House at Ilkley"—here again note the foreshortening of the metal work to staircase, a difficult task, put in with admirable and apparently effortless precision. Mr. Davison is also represented by "Whiteley Homes," a drawing for Sir Aston Webb, R.A. Other exhibitors whose work is so familiar to us at the present time that it is unnecessary to comment on are W. Walcot, Curtis Green, A.R.A., C. W. English, Robert Atkinson, Cyril Farey, T. S. Tait, P. Hepworth, L. H. Bucknell, Winton Newman, Geoffry Lucas, and others. The exhibition is of considerable interest, and should be visited by all who are interested in draughtsmanship.

In conclusion, perhaps one might say tricks of draughtsmanship are more prevalent to-day than they were 20 years ago. In no drawing of the older men does the famous sediment trick appear—the mop-head tree, the fretwork or scenic tree. Perhaps these older men went more frequently to nature.

WOMEN ARTISTS.

Amongst nearly seven hundred exhibits at the Society of Women Artists' Exhibition, at the Institute, there is a good deal of clever work, even if most of it lacks any particular distinction. One can only hope that the production of all these things has given the artists themselves a certain pleasure, and that the object of it has not been chiefly to earn money. We miss nowadays the distinctive work of such artists as Clara and Hilda Moutalba, and probably one vital drawback in so much of it is the lack of really good subjects. Colour effects are sometimes quite good, as is the pleasant "St. Ives Harbour" (No. 309), by Miss Hewitt; the "Blue of the Sea" (No. 279), by Constance Bradshaw; "The Pool" (No. 268), by M. Attenborough; "Hazy Morning, St. Ives" (No. 233), by Constance Bradshaw; "A Bridge, Venice" (No. 220), by Florence A. Englebach; and the excellent water-colour drawing of "The Padre's Wistaria" (No. 39), by Evelyn I. Rimington. A broad, simple and impressive sketch is "In Old Verona" (No. 54), by Marianne Niven. Some good jewellery, modelled figures, decorative pottery, and hand-woven scarves add to the interest of the exhibition, and suggest how greatly the general effect of picture shows may be improved by the interposition of decorative accessories between various groups of pictures. If we knew of the work of women artists only through such an exhibition as this, we should be inclined to estimate the value of their work as artists lower than it actually is. Mere prettiness is a delusion for all, but an exhibition such as this would suggest it as a peculiar drawback to the work of women painters. Certain it is that we are here very definitely confronted with the doubt as to the value of the aims which bring most of these pictures into being. Some definite arresting charm of line or colour, of mass or composition—some summarised vision of natural beauty—some accentuation of real charm to be carried forward from the artist's own realisation to the mind of others—these are the aims of the artist, even if imperfectly fulfilled, which ought surely to appear in a greater degree than we find in this large exhibition of the Society of Women Artists.

Design Placed First: By Messrs. Davis & Emanuel and Henry C. Smart.

BIRMINGHAM ARCHITECTURAL ASSOCIATION.

Housing.

At a recent meeting of the Birmingham Architectural Association, Major Harry Barnes, V.-P.R.I.B.A., gave an address on the housing question. He said that the dilemma in which they stood to-day was that a standard of housing had arisen which never had been in the past, could not be in the present, and did not appear likely to be in the future, provided for a considerable section of the population of the country; the reason in all cases being that such a house as the present standard demanded could not be provided at a rental within the capacity to pay of a considerable and increasing proportion of the wage-earners of the country.

He expressed the opinion that the present housing problem was not the result of the war but of a steady accumulation of arrears extending over the whole century. The increase in houses in each decade had always been less than the increase in families, and he gave the following figures in support of his statement :—

Year.	Houses.	Families.
1811	221,581	245,425
1821	290,652	351,276
1831	393,388	418,451
1871	519,612	557,492
1881	572,402	584,076
1891	619,978	487,809
1901	809,355	905,867
1911	880,929	968,422

The result was that there had been a steady increase in the number of families for whom no separate dwellings were provided.

He then dealt with the question as to whether, in estimating the number of houses required, population should be taken as the basis or the number of marriages in each decade. The importance of this point was that if population were taken as the basis the increase in population during the last decade had only been half of that in the former decade, and on that basis it might be argued that only half the number of houses were required. He expressed the view that the proper basis for calculation in determining the number of houses which were required from decade to decade was the number of marriages in the decade—that it was the marriage which created the demand for the new dwelling. On this basis he pointed out that though in the decade ending 1921 the increase in population had been only half of that which took place in the decade ending 1911, the number of marriages in the later decade was nearly half-a-million more than in the former one, the figures being 2,640,515 for the decade ending 1911 and 3,075,903 for the decade ending 1921.

For the decade ending 1911 there had, in fact, been an increase of 840,640 houses, and if the marriage basis was the proper one, it was clear that the number required to satisfy the marriage claims in the decade ending 1921 was approximately 950,000.

On the capacity of the building industry, he said that on an examination of the Census Returns, in so far as the number of men engaged in the building industry were concerned compared with the number of houses produced in each decade, the result showed that the average over sixty years was 1 house, 1 man, 1 decade. He quoted the following figures :—

	Men.	Houses.	Average. Houses per man.
1851 ..	.. 463,491	.. 492,666 ..	1.06
1861 ..	.. 472,103	.. 596,263 ..	1.26
1871 ..	.. 581,903	.. 697,733 ..	1.2
1881 ..	.. 685,112	.. 605,486 ..	.88
1891 ..	.. 698,839	.. 886,103 ..	1.27
1901 ..	.. 952,093	.. 840,649 ..	.88

or an average over the sixty years of 1.09

On that basis, if it were adopted for the purpose of estimating, and it seemed a sufficiently broad basis for that purpose, it might be expected that for every man in the building industry in 1921 we might get an additional house by 1923. The latest figures of men in the industry were for February, 1923, 625,400. Therefore, on that basis, unless exceptional activity was shown and extraordinary means employed the normal output for the decade was not likely to exceed 700,000 houses, leaving us with a shortage of anything up to half-a-million.

On the figures that were the result of recent housing experience, a round figure could be taken was that the number of houses that could be produced was equal to 1 man, 1 house, 1 year; that was to say, that for every man engaged upon house building they might expect to get one house in the course of a year. The figures already given showed that what was obtained was 1 house, 1 man per decade, the conclusion of which was that during the past there could not have been more than one-tenth of the men in the building industry employed upon house building for the working classes.

If normal conditions prevailed, it could not be expected that more than one-tenth, or 70,000, of the men engaged in the building industry at the present moment would be engaged on the erection of houses for the working classes, and on the basis of one man, one year, one house, it would give us 700,000 in the decade—a figure again closely related to the one already obtained.

The lecturer concluded by expressing his view that on all the facts that could be ascertained, the situation in 1931 so far as housing was concerned was likely to be worse than that in 1921.

BIRMINGHAM ADVISORY ART COMMITTEE.

The city of Birmingham appears to provide a fruitful soil for the modern efforts towards a better general amenity of city life. The foundation of the Birmingham Civic Society was a happy circumstance, and now we have the report of the Birmingham Art Advisory Committee for the year ending December, 1923, which amply proves the success of its work and the justification for this further extension of effort for city improvement. Some explanation of the success may be found in the presence on the committee of the Lord Mayor, the City Engineer, the Vice-Chancellor and Principal of the University, besides Directors of Schools of Art and Architecture, representatives of the Civic Society, &c., Mr. Wm. Hayward, F.R.I.B.A., being the able secretary. It is quite obvious that the full value of such an advisory committee cannot be set down in its report.

The eighth item in the constitution of the advisory committee reads as follows :—

8.—Hereafter all such *new* designs for public buildings, bridges, lamps, gates, fences, public conveniences, or other structures to be erected upon land belonging to the city, all such proposals for planning and laying out new parks or park extensions, all such new statues, fountains, arches, monuments or memorials of any kind to be erected in any public street, square, park, or municipal building as may be selected for submission to the Advisory Art Committee by the City Departments concerned, shall be reported upon by the Advisory Art Committee.

As to the work of the committee we note the following in the report :—

Experience with 57 submissions made during the year ending December 31, 1923, led to the delegation of personal consultation and the preliminary examination of designs to those members of the committee having a special technical knowledge of the subject under consideration. This arrangement has worked well and will be continued; it is found to be absolutely necessary to a proper understanding of the designs submitted, and gives opportunities for suggestion and adjustment before coming to the committee for report. It is obvious that in many cases a design can only be properly judged after an inspection of the site for which it has been made. A delegate of the committee has, therefore, visited each of the sites in question; and in many cases the choice of sites for shelters, refreshment rooms and lavatories in parks has been left to the committee's representative, subject to the approval of the Parks Committee.

That the action of this committee has had much influence on other big centres is an item of special value in its work, and it is to be noted that its inception was due in the first instance to the Birmingham Architectural Association.

SHEFFIELD SOCIETY OF ARCHITECTS AND SURVEYORS.

Steel Construction.

On February 14 Professor J. Husband lectured on this subject before the Sheffield Society of Architects and Surveyors.

In the course of his remarks he stated he proposed to notice some of the aspects of steel construction of more particular interest to architects, and would, therefore, confine his remarks to matters relating to steel buildings.

Two distinct types existed—low buildings in which wind stresses were small or negligible, and lofty buildings on which wind pressure was of great importance and strongly affected the design. In this connection the experience gained from the design and erection of the tall steel-framed buildings in the United States was valuable. In this country architects and engineers were seldom called upon to erect buildings exceeding ten or twelve stories in height. The steel buildings might be divided conveniently into four units—the foundation, stanchions, floor system, and roof. The requisites of a good foundation were enunciated and the importance emphasised of distributing the load in order to ensure uniform settlement of all parts of the framework. The purpose for which the building was designed determined the stanchion positions and consequently the foundation areas. The lecturer devoted considerable attention to special features in the design of floor beams and to their duty in resisting effects of wind pressure in buildings where special wind bracing was not provided.

An interesting comparison of the relative merits of flat and sloping roofs and consideration of wind and snow loads was followed by an examination of the general effects of wind pressure on the members of the framework and of the various systems employed for the wind bracing in buildings, special reference being made to this feature in the case of very lofty buildings.

Acquisitions at the National Gallery.

Two paintings have just been acquired by the National Gallery, and are now on exhibition. The first, which hangs in Room XII, is a signed work by Jacob Ochtervelt (c. 1635–1700), and represents a lady playing a spinet, accompanied on the violin by a gentleman, while another lady conducts. In this work the painter shows himself under the influence of Vermeer of Delft, and for a moment acquires something of that master's luminous atmosphere and power of design.

The second painting, which hangs in Room III, is a group of three figures seen in profile, looking out of a window in a fortress on the sea. In one corner are the arms of the Montefeltro family. The identity of the persons represented has not been finally settled; but it is thought that the boy holding a book is probably Guidobaldo Montefeltro, who, in 1482, succeeded his father, the famous Federigo, as Duke of Urbino. This curious panel appears to be the work of some pupil of Melozzo da Forli.

THE ARCHITECTS' AND BUILDERS' INQUIRY BUREAU.

Provisional Amounts.

SIR,—Can you tell me how the law stands in regard to provisional amounts? Where a provisional amount has been inserted in the specification and the builder goes into liquidation before the contract work is finished, is an architect justified in issuing a certificate to the merchant or sub-contractor to the full amount of the provision and deducting the said amount from any money due to the builder; in other words, has the merchant or sub-contractor, in such cases, the right of preferential treatment over other creditors? If so, does the rule apply equally if the builder is not actually bankrupt, but has made a voluntary composition with his creditors? Also, is it necessary that the name of the merchant or sub-contractor should be inserted in the specification, or is the provisional amount alone sufficient? If the amount of the goods supplied exceeds the amount of the provision, can the merchant still be paid in full? "NO LAWYER."

[REPLY.]

The contract must, in the first place, be scrutinised, to find if there are any clauses defining the rights of the employer or the architect as to provisional sums. A consideration of the following, however, may assist:—

Provisional sums are inserted in building contracts in order that such sums shall be for the direct use of the employer. The builder must give credit for the full amount of the provisional sum, and, where the provisional sum is used wholly or in part the rule that obtains is to allow the builder the nett price paid for the work ordered, plus a profit of 10 or 15 per cent., or, the percentage of profit as fixed to the provisional item in the priced bill of quantities. If the provisional sum is exceeded, the amount by which it is exceeded is an "extra" on the contract, and must be treated as such in all respects. If a provisional sum is inserted in a contract for a specific work, and to a specific contractor, it would appear that if the work is omitted, or given to another contractor, the employer may render himself liable for damages for loss of profit to the sub-contractor direct, or through the general contractor were the sub-contract made by him; also for any additional profit the general contractor had provided for himself in his estimate.

An employer cannot withhold payment to the builder of money due under the contract, and pay it direct to a specialist or merchant with whom he has no privity of contract, unless there is an express provision enabling him to do so.

When an architect has power to direct payment of provisional sums due to the merchant or sub-contractor, the employer is liable to pay the merchant or sub-contractor; and, when there is an express condition that the employer is empowered to pay the merchant or sub-contractor in the event of the builder failing to do so, the employer may deduct the amount from monies due to the builder (to the full extent of the provisional sum only) and pay the merchant or sub-contractor direct. Such power is not annulled or revoked by the bankruptcy of the builder; and, should the employer avail himself of the power, the merchant or sub-contractor is entitled to be paid in priority to the builder's trustee in bankruptcy. It is not, however, a question of preferential treatment, but merely a fulfilment of the terms of the contract. The fact that the name of the merchant or sub-contractor does not appear in connection with the provisional sum in question does not affect the general rule, and the above matter applies equally in the case where the builder has made a voluntary composition, since "the greater includes the less."

The following cases may well be referred to:—Hobbs *v.* Turner (1902) 18 T.L.R., 235 (which was followed in Young & Co. *v.* White (1911) 28 T.L.R., 87); and in *re* Wilkinson *ex parte* Fowler (1905), 2 K.B. 713.

Hard Wearing Floors.

SIR,—I have a large dining room, about 80 ft. by 70 ft., which has, at present, a concrete floor rather badly worn, and I want to cover it with something that will be durable, efficient, and will stand hard wear (*i.e.*, workmen's heavy boots).

(*a*) Cement rendering is unsightly and cold.

(*b*) Composition flooring is considered fairly suitable, but will it stand a certain amount of ill-usage?

(*c*) Wood flooring and ordinary floor tiles are not suitable in this case.

(*d*) Can you suggest anything else? If so, would you give me names and addresses, as I am anxious to put the work in hand at once.

C. T. MORRIS EVANS.

[REPLY.]

Any good class composition floor would seem to be the best material for our correspondent to adopt. There are several good varieties advertised in our pages, and he will appreciate that we cannot particularise any individual kind. The writer remembers inspecting such a floor in a Working Boys' Club in the North of England where, after about a year of the hardest wear, the surface showed no sign of failing. The surface is, however, cold, and may be thought to have the same objection as cement, but the appearance is warm and cheerful and, after all, the eye can do much to reassure the feelings. One word of warning: These floors need careful attention to ensure their successful maintenance. Polish often and be sparing with water.

The Builder of the Albert Hall.

SIR,—I should be very much obliged if you could let me know the name of the builder who built the Albert Hall, also the name or names of the people who had it built. R. S.

REPLY.

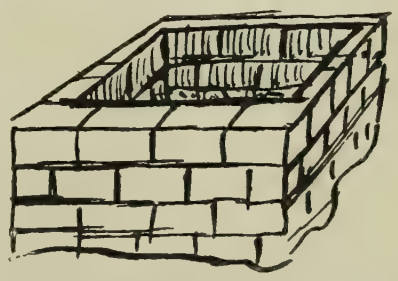
The Royal Albert Hall, Kensington Gore, was suggested by the Prince Consort. Its huge amphitheatre measures 273 ft. in length, 240 ft. in breadth, and 155 ft. in height, its designer being Lt.-Col. Scott, R.E., who was assisted by an architect, Thomas Verity, who afterwards erected "The Criterion" in Piccadilly-circus. The Albert Hall was built by a joint stock company and cost £200,000. The structure consists of two concentric walls between which are corridors and staircases planned on an oval layout, the interior dimensions being 219 ft. 4 in. and 185 ft. 4 in. respectively. The roof consists of light wrought-iron work with a flanged curb resting on the top of the wall, 120 ft. high from Kensington-road level. Iron shoes bolted on this curb furnish the springers from whence the curbed ribs spring. The curved principals are capable of carrying their own weight together with the weight of seven rows of purlins set between them, as well as the rafters and the ceiling. The thrust bearing on the main ribs is taken by the main wall plate, and the strains of these ribs are adjusted by means of wedges between the wall plate and the foot of each rib by the slackening or tightening of which the whole of the thrust is brought upon these curved ties resting on the wall. The top flange of the rib, acting as an arch, communicates the strains produced under every variety of loading, pressure of wind and snow. The exterior of the edifice is faced with brick and terra-cotta. The rotunda is enriched above by a noble figure frieze, carried out by Minton, depicting the various peoples of the globe. These groups were designed by Pickersgill, Armitage, Stacey Marks and Edward Poynter, subsequently President of the Royal Academy. The large porches on each side add effective shadows and colour to the vast pile, to which they furnish scale and contribute the grandiose character to the composition which otherwise is not very beautiful. The organ is by Willis, and the auditorium seats 8,000 persons. The building was executed between 1867 and 1871.

Concrete Members Subject to Combined Stress.

SIR,—I have been studying Dr. Oscar Faber's articles in your issues of January 5 to 19, 1923, on reinforced concrete members subject to combined stress, and there is one point on which I should be glad if you could enlighten me. In the case of combined bending and thrust (Case I), the moment of inertia is calculated about the centroid of the section; but in Case II as the lever arm is given as $d\frac{N}{3}$. The resistance of the member is calculated about the neutral axis. Am I correct in this assumption? And if so, can you explain the apparent discrepancy?

Norbury. EDGAR BUNCE.

[REPLY.]



Mr. Bunce is quite correct in stating that the moment of inertia is calculated about the centroid of the section, but in Case II the lever arm, sometimes called the radius arm, is given as $d\frac{N}{3}$. There is, however, nothing whatever inconsistent about this. The moment of inertia varies according to the line about which it is calculated, but the resistance moment of a member is independent of the line about which it is calculated and consists merely of the total compression or the total tension multiplied by the distance from the centre of compression to the centre of tension. It will be seen that both these quantities are entirely independent of any particular line or position to the centroid or neutral axis, and depend solely on the distance from the centre of compression to the centre of tension.

May I take this opportunity of correcting example 2, under "Bending and Compression," in your issue of January 19, 1923? The curves, tables and mathematics are prefectly correct, but, unfortunately, a slip occurred in the solution of this particular example. $\frac{P}{bd}$ taken from the curves should be 270 instead of 85. The effect is to make the breadth 3.7 in. and the area of steel rods in proportion. I may add that nothing else in the article is in the slightest degree affected by this slip, but I thought it well to make the correction in case anybody should be puzzled by the original error.

OSCAR FABER.

Chimney Flues.

SIR,—Could you tell me the actual average prices per foot cube or yard cube quoted by the contractors for building a chimney flue of ordinary bricks, like this—

I wish to know this price in order to see if it would be possible to introduce in England a new system of chimneys, already known in other countries. H. BOLLIGER.

[REPLY.]

Our correspondent's sketch is not quite clear to us, but we take it to represent an ordinary chimney flue 9 in. by 9 in., or 14 in. by 9 in., or perhaps 14 in. by 14 in. Such flues are generally measured and estimated for as though in solid brickwork, without deduction for the cavity. The extra labour of building quoins and gathering over is thus compensated for by the extra material allowed.

Brickwork at £30 per rod works out at about 13s. 3d. per yard super at 9 in. thick, or £2 13s. per yard cube. This would include the flue and the surrounding brickwork.

TOWN-PLANNING INSTITUTE.

Mr. Mawson (President) took the chair at a meeting of the Town-Planning Institute held recently at 92, Victoria-street, when further discussion took place on the subject of "Streets" (as defined in the Model Town-Planning Clauses issued by the Ministry of Health). A summary of Mr. E. R. Abbott's paper for the discussion at the first meeting appeared in *The Builder* of December 28 last.

Mr. F. C. Minshull (Chief Assistant Solicitor to the Birmingham Corporation) contributed a second paper and said he agreed with the view expressed that town planning was primarily and strictly concerned with arterial routes only where these approached, crossed or affected the development of existing human communities. He was not one who thought it impossible for town planning to be too ambitious in its scope. The speaker first gave a summary of the historical development of the legal formulæ annexed to the map which, he said, even the most enthusiastic legal non-member reluctantly conceded to be necessary. He dealt with the several Birmingham schemes, the Ruislip-Northwood, Rochdale, North Bromsgrove, Otley, Hunslet, Leeds and Wallasey schemes, and said the Model Clauses followed as to streets along the general lines first laid down in the Ruislip-Northwood scheme, supplemented by the limitation of expenses to the cost of street works not exceeding a by-law width.

The difference between the Ruislip-Northwood scheme and the Model Clauses were dealt with by Mr. Abbott. The right of entry upon notice was conferred by Model Clause 6, but it was not so useful a right as might appear at first sight, for they could not touch a single forecourt of a dwelling-house except by agreement, because it was required for the "amenity or convenience" of the building within the terms of the section. Some Councils were specially enabled to prescribe frontage lines with power to acquire compulsorily unbuilt-on-land lying in front of such lines. It would be seen that in the absence of some provision of this kind too much optimism must not be displayed in anticipating the unimpeded construction of new streets or widenings under town-planning schemes through lands which had ceased to be merely agricultural. Clause 9 involved some consideration of the effect of Section 58 in the matter of compensation. Unless there was some express prohibition of building upon lands appropriated for one of the purposes of a scheme he did not see how such building could be regarded as a contravention within the meaning of Section 57 of the Act of 1909. The other street clause, upon which he especially wished to invite comment, was Clause 2. A clause of this kind was to be found in nearly all the existing schemes, often expressly in addition to the powers conferred by Section 17 of the Public Health Acts Amendment Act of 1907. But when they considered the clause it conferred a formidable power: "Whenever a plan for a new street is submitted the Council shall" (not may) require the "owner of any land within that part of the area, the development of which, in their opinion, will be affected, to furnish plans and particulars showing generally a scheme for the development or laying-out of the land." Why should such owner be put to the expense of preparing plans and consulting experts? The new street might not even be constructed. He would like to make some observations on a new type of clause not included in the Models. It was one included in a scheme before the Minister for approval, which sought to avoid the Scylla of uncertainty on one side for the Charybdis of inelasticity on the other. It followed the lines of a section in a Liverpool local Act, and was designed to enable the provision of traffic streets as and where their need might appear. First, the responsible authority was empowered, with the approval of the Minister of Health, to make an Order determining to construct a traffic street on any land within the area. Traffic street was defined as "A main thoroughfare or a continuation of a main thoroughfare, or a means of communication between main thoroughfares, or a main approach or a continuation of a main approach or a means of communication between main approaches." The owners of the lands concerned were, upon the expiring of the prescribed notice, to give access thereto to enable any surveying and measuring necessary in the preparation of plans. Before applying for approval of the Order the authority was to give notice and plans to the owners concerned, as well as notice by public advertisement. Secondly, the effect of the Order (into which the Minister was to introduce such modifications as he might think fit) was to cause the traffic street to which it related to be deemed to be included in the scheme as a new street, the claim for compensation, of course, to be made within a year from the expiration of the notice requiring entry for the purposes of street construction. The clause provided, as it were, for the making of a little scheme upon a scheme; and it was a course of procedure which, if so regulated as not unduly to entrench upon public confidence, might do much in the future to enable schemes to adapt themselves to changing developments, which could not be foreseen, and in directions too slight to call for the heavy artillery of a supplemental or amending scheme. Mr. Minshull touched on other clauses, including 10 (7) as to the construction of streets by owners, in regard to which the appeal is to the Minister. He did not question the excellence of such a tribunal, but many landowners and other interested parties regarded an appeal to the Town-Planning Department as an appeal to the executioner rather than to the judge. And there was some ground for the argument in favour of the local Bench who, however, far from being town-planning experts, at any rate, knew the town and were of like passions with the townsmen. To ensure the success of town planning it was a truism that the spirit of co-operation and sweet reasonableness must prevail. Much of the difficulty as to adaptation, however, beyond doubt arose through a tendency to town plan in the dark—to develop details beyond the point to which prophecy based on present development could safely go. If this natural temptation was repressed in time the advantage should surely be found in economy both in money and the vital energies of surveyors and town clerks. They must not make the mistake of over-reaching testators who endeavoured to keep the dead hand upon their posterity for all time.

Mr. E. Willis (Surveyor, Chiswick U.D.C.) urged the impossibility of defining a standard street, although it might be possible to define a number of standard streets. The first thing to do was to define the standard traffic, and the standard he had always advocated (and which to some extent had been supported by the Ministry of Transport) a traffic unit of 10 ft. for roads where the traffic was essentially of a main or arterial road character, 9 ft. for a Class 2 road, and 8 ft. for an ordinary street or local road. They should never go below the 8 ft. unit. The difficulty of the standard street was increased by the question of construction and it could be overcome only by taking certain areas, for what was suitable for one area was not suitable for another. With regard to sterilising land, he saw no reason why Mr. Marshall should be concerned, because in his own case permanent buildings were not allowed on such land, but temporary buildings were allowed subject to removal without compensation.

Mr. S. A. Kelly (Liverpool), in a written communication, expressed the view that in regard to new arterial roads, the owner should be responsible for the cost of a 36 or 40 ft. street, according to the by-laws in force. The payment for this should be imposed as a frontage charge when the adjoining land was developed or sold or leased for building or other purposes, and any extra width of land required should be sold at its unimproved value. This was for large owners, and small owners must of necessity be dealt with on a different basis, as in many cases they would be left with very little land to develop. The owner should only be charged with the cost of an ordinary constructed road.

Mr. G. L. Pepler said it was quite clear that the making of a scheme put a restriction on the land, and any claim for compensation must be made within twelve months, and consequently when the land was taken it would be taken at its value subject to the restrictions the scheme put upon it. The object in introducing the standard street was simply to meet the question of charge. The owner would be called upon to pay for a street of the standard in the district which he was ordinarily called upon to pay for and nothing more.

Mr. Lovelock (Carshalton) commented on the narrowness of streets in some of the schemes, and said he foresaw the time when in the estate in his district some of them would have to be widened. Taken as a whole, he thought the Model Clauses would be very helpful, particularly in regard to the laying of sewers.

Mr. Raymond Unwin agreed with Mr. Pepler as to the meaning of the standard street. It was impossible to have a common standard, and therefore they must in each district take the local standard as the basis for assessment. He agreed with Mr. Willis as to the necessity for different widths of streets for different classes of traffic, and they would come then as to whether there should be any regulations of the width of vehicles. No doubt in the enthusiasm of economy in some housing schemes roads of too narrow a width had been made, but on the whole there had been remarkably few complaints.

Mr. J. M. Jopling said he was in favour of making the roadway as narrow as possible, but it was important to make the side-walks as broad as possible. In Paris and other Continental cities, where people lived in flats, they spent a lot of their life in the streets and the side-walks were broad. He noticed on coming back to England that the habits of the people were changing in this respect, for the side-walks in London were not wide enough. In Bombay, broad roads were made with narrow side walks, and the people used the roadway. On coming back to England after years of absence, he was surprised at the absence of knowledge and interest in town planning by the average Englishman.

Mr. H. V. Lanchester agreed with the traffic units put forward by Mr. Willis. He also raised the point of whether a local authority, making an arterial road under a Ministry of Transport grant, could take enough land on either side of the road to create decent building frontages.

Mr. Reay Nadin said that in many parts of the country, where arterial roads had been made, there had been reserved sufficient land for building frontages, so that the local authorities might recoup themselves for the large outlay they had gone to in conjunction with the Minister of Transport. The condition precedent was that some portion of the land taken must be for the making of the road. He would like to draw attention to a clause now before the Minister and the Association of Municipal Corporations, dealing with the question of the acquisition and sterilisation of land and the subject of compensation. The clause enabled a local authority, when an application was made to it for approval of the formation on any estate or lands of a new street, or widening, which, in its opinion, would form a new thoroughfare or means of communication between main thoroughfares, to require a width not exceeding 80 ft. The owner, however, would not be called upon to incur any greater expense in the execution of the street works than he would have been required to do under the by-laws in force, and the additional expense involved in making the street of a greater width would fall on the local authority. Compensation would be assessed in the manner provided by the Acquisition of Land (Assessment of Compensation) Act, 1919, but in estimating the amount of compensation, the benefits accruing to the owner by reason of the greater width of the road should be estimated and set against the compensation.

AEROPLANE PHOTOGRAPHIC SURVEY.

At an ordinary general meeting of the Surveyors' Institution recently, Major M. Macleod read a paper on this subject. In the course of his remarks he said the process of survey might be divided roughly into two parts, the first consisted of the fixing, by instrumental observation and subsequent computation, of the positions of a certain number of selected points, and the second the drawing in of the detail between these points. Topographical surveys were really nothing more than sketches of the ground made by eye. Points for control were required only because hand and eye working together could not accurately copy the ground except over short distance. Even the most skilled workman had to fix for himself, with the aid of instruments, a very large number of points, and had to spend a long time on the ground, both for his actual drawing and for moving about over it. During all this time he was liable to be interrupted by weather or delayed by obstacles.

The attraction of the camera as an instrument of survey laid in its power to make an accurate picture of a comparatively large area, without the aid of an elaborate control of previously fixed points, in a very short time. More than fifty years had elapsed since the first attempts were made to exploit its possibilities for this purpose, but until the advent of aeroplanes its successful use had been mainly as a means of replacing theodolites and other instruments for measuring angles and fixing points. Attempts were made to employ it from balloons, for making a direct picture, by pointing it perpendicularly towards the ground to be surveyed, but the difficulty in getting a balloon exactly over a particular spot was so great that practical success in these endeavours was small. As soon, however, as the perfection of aircraft allowed the camera to be transported to a position vertically above any region, survey by what might be called "direct" photography became a practical proposition. The development of aeroplane photographic survey might be said to have commenced in earnest during the Great War, when military surveyors had to apply themselves to the difficult task of making accurate large-scale maps of intricate trench systems.

The stabilisation of so large a thing as an aerial camera by gyroscopes or other devices depending on force was a difficult matter, and might be ruled out, but Professor Melvill Jones had shown that, by training pilots and by using a gyro rudder control, it was possible to stabilise the machine within quite small limits. If this could be done and the machine could be flown at a uniform height, the photos taken could be fitted together so as to form a "mosaic" whose scale could be determined with very fair accuracy from only two points which appeared on it. Practically, slight variations of height would occur during the flight, and these "mosaics" required a certain amount of "adjustment" in addition to the simple enlargement or reduction required to bring them to a particular scale. The photos had to be taken during a straight flight, and the prints when fitted together formed a strip which consisted of a dozen or more photos. Professor Melvill Jones had found that the most convenient way of making the adjustments necessary was to stick each print separately on to a long piece of elastic which was slightly stretched before they were attached. The prints were, in the first instance, enlarged or reduced as nearly as possible to the correct scale, and each was fitted as exactly as possible to the one next to it by means of any overlap there might be. The final adjustment was made by slightly easing or further stretching of the elastic. A complete map could be made up by series of parallel strips having a small overlap with one another. This was probably the cheapest, quickest and simplest method of covering an area, and was suitable for comparatively small-scale work where great accuracy was not essential and where the ground was not greatly accidented.

In the other direction the Air Ministry was working on a gyro tilt-recorder which was quite small and seemed to hold out good prospects of success.

From the economic point of view the expensive part of an aerial survey was the cost of keeping a machine in the air. It was of the first importance to be able to photograph the whole area in the shortest possible time. The taking of the photographs must be organised so that each flight completed a definite area without unnecessary overlaps and without gaps.

Gaps were particularly troublesome, as it was difficult to locate them without a map on a subsequent flight, and it was said to be actually quicker to re-photograph a whole area than to attempt to fill in two or three small gaps in a previous series of photographs. Now, if the camera was not stablised at all, it was obvious that gaps were much more likely to occur than if the direction in which the camera was pointed was controlled. From this point of view the stabilised machine had the advantage. Up to the present, however, they had neither perfectly stabilised machines nor perfect tilt-recorders. For every class of accurate work an indispensable preliminary to any aerial survey was a framework of control-points, fixed and marked on the ground by the surveyor on foot.

The problems of aerial photographic survey, then, resolved themselves into two different categories—

(1) The nature and extent of the control and how to provide it; (2) how best to use the control-points for eliminating tilt and other distortion from the photographs.

A trigonometrical control executed on the ground was desirable, in fact, necessary for any form of survey. For accurate, as opposed to reconnaissance, work it was essential. Aerial survey was no exception, but the points usually fixed by an ordinary trigonometrical survey would most probably be unsuitable for aerial work. Peaks of hills, beacons, tall chimneys, church spires, and similar features, conspicuous and unmistakable to a man on foot, were often impossible to identify with certainty on an aerial photograph.

On the assumption that accurate survey was contemplated and that an adequate control could be provided, the lecturer passed on to a brief outline of the various methods which had been used or suggested for making use of it. They might be divided into three classes:—

(1) Graphic methods; (2) Rectification methods; (3) stereophotogrammetry.

In graphic methods the photo was usually replotted point by point by means of some form of "grid." This grid was first drawn on the map in a definite relation to the control-points, and a corresponding grid, distorted according to the tilt, was drawn on the photographs by some kind of geometric construction, based on the principles of perspective. By making the "mesh" of this grid sufficiently small, the position of any point could be interpolated on the map from its relation to the grid on the photo.

"Rectification" methods depended on the use of a projecting lantern or some analogous device for projecting an image of the fie negative on to an adjustable screen. The control-points, four in number for each photograph, were plotted on the screen, and camera and screen were adjusted until the corresponding points on the image projected into these positions. This adjustment could be done by trial provided the projecting lantern was so designed as to give the various parts the requisite range of movement. It was, however, rather troublesome, especially if the tilt were considerable, as it involved correlated movements of the negative, and the lens as well as the screen. The difficulties were due largely to the fact that the dimensions of the image had to be varied not only by the direct longitudinal movement required for ordinary enlarging but also by tilting the screen. This upset the focus, which must be corrected by tilting lens and negative. This in its turn again altered the dimensions of the image, and so on. The adjustment would be considerably easier if the process of taking the photo could be simply reversed; if they could, as it were, take the aerial camera out of the aeroplane, put a light behind it, and use it as a projecting camera. It was, however, focussed for infinity, and they required an image on a screen a few feet away from the lens. Some systems of map-making did, in fact, employ essentially this system, and relied on stopping down the lens to sharpen the image, but he felt fairly confident that the results could not be completely satisfactory. In any case the adjustment by trial became very complicated if the control-points were of different heights, and in his opinion it was better to determine scale and tilt by a preliminary process and use these elements for calculating the positions for the various parts of the projecting lantern.

There were several ways of determining scale and tilt, either by graphic constructions or by computations based on linear measurements made on the negative. All these, again, were troublesome and complicated if the control-points were of different heights, yet it was precisely under such conditions that "rectification" was likely to be most useful.

Those who were interested in the details of a purely mechanical solution by means of a piece of specially designed apparatus called a "tilt-finder," would find a description of it in a recent number of the journal of the Royal Geographical Society. Having determined tilt and scale, the positions in which to set the various parts of the projecting lantern, so as to give a print in sharp focus, to a given scale, and from which tilt distortion had been eliminated, could be calculated from fairly simple equations. This computation and the setting of the parts in position naturally took a certain time; but when complete, the whole photo was dealt with in a short exposure plus a few minutes for developing and fixing the print. There was undoubtedly a net gain in both speed and accuracy as compared with the tedious processes required in plotting a photo point by point by any graphic method. If one compared the two, one might say that rectification methods were preferable when the map had to be prepared *ab initio*, and that graphic methods were often convenient for adding information required to bring an existing map up to date.

Stereophotogrammetry, the third alternative, had been developed recently in Germany with a remarkable degree of practical success. Starting from the principle of the "stereoplotter" (invented by the late Major F. V. Thompson, R.E.), Professor Hugershoff, of Dresden University, had devised a machine called an "autocartograph," which enabled a map to be drawn from two oblique aerial photographs of the same area taken from view-points sufficiently close together to enable the two to be combined as a stereoscopic pair.

It was necessary, as a preliminary step, to determine the positions and heights of the two view-points and the direction of the optical axis of the camera at each. This could be done by a preliminary computation if three control-points appeared on each photograph.

From this data the machine could be set in adjustment and the stereoscopic view transferred quite mechanically on to a map or plotting-board. The method of operating was generally similar to that employed by Major Thompson and also in the "stereoautograph" of Von Orel. That was to say, a "mark" or "pointer" appeared in the field of view, and could be made to coincide both laterally and in depth with any desired point in the landscape, which was seen "in relief."

In conclusion, the lecturer said, although the aerial photograph had great possibilities, he thought it evident it had many limitations as a means of survey.

APPROXIMATE ESTIMATES.

In our last issue we reported two papers read at the Surveyors' Institution by Mr. A. Paull and Mr. J. J. Done, on "Approximate Estimates," and a report of the discussion on these papers is given below.

Mr. F. H. A. Hardcastle said the method of cubing up held the field. It was a rough method of calculation, but in the hands of a man of experience and judgment a tolerably close forecast could be made. He saw that a dictionary definition of "approximate" was "reasonably correct." He rather hoped that some more accurate and reliable method of arriving at approximate estimates might be arrived at.

Mr. A. Burnett Brown, in seconding, said his own view of approximate estimates was that they were those which were not based upon a full and proper bill of quantities prepared by a quantity surveyor. Broadly, he would venture the assertion that competence in the very difficult art of forming approximate estimates of a fairly accurate character could only be acquired by long experience, close observation, and accurate deduction. He advised the younger members in framing approximate estimates never to be afraid of overestimating.

Mr. Dryland Haslam contended that in the development of an estate it ought to be compulsory that the tithe as well as the land tax should be redeemed.

Mr. Cuthbert Lake said there was only one piece of advice to give to junior members about approximate estimates in valuation work as distinct from building work, and that was "Don't." His knowledge of approximate estimates warned him against the judgment of anyone who depended upon them. No one would pay for approximate estimates.

Mr. J. E. Drower said that was the first time, as far as he could understand, that they had ever had a paper which dealt purely with the techniques of quantity surveying. He did not quite understand what other word they could use, but "approximate" estimate, and, as they had it, he thought they had better keep it. They all knew what was meant by an approximate estimate. Anybody could take out the quantities roughly, but who could price? Someone had spoken of the intuition people had in pricing. It was an intuition with many people, and an intuition which could not be explained. It was certain there was a strange intuition which enabled them to deal with figures with great accuracy.

Mr. Christopher Chart agreed with Mr. Alan Paull that cubeing held the field as the most general method of estimating the cost of building work. Within the past month he had seen tenders for two new housing schemes, and the difference in the price per foot cube of the two sets of houses varied as much as 1½d. In the one case the houses were to be built in blocks and in the other case very much smaller houses were to be built in pairs.

Mr. A. G. Cross remarked that many members of the Institution worked at the Ministry of Munitions in regard to the provision of munition factories. They stated the number of squares in the area and based cost upon so much a square. That, on approximate quantities, he thought far and away the best method of obtaining an approximate estimate.

Mr. A. E. Baylis expressed the opinion that cubeing was the most common, but the least satisfactory method of arriving at an approximate estimate. He had in mind housing schemes where the cost came out too much. The architect replanned the cottages and actually lessened the cost; he showed the original plan to the builder, who said, "Oh, yes, take it on the cube." But the builder was not going to be paid on the cube; he was going to be measured up and paid on his schedule. Instead of the cottages being, as the architect anticipated, £50 less they came out at £50 more. Although the architect knocked off £50 worth of work on each cottage, the actual work increased the value £50.

Mr. William Woodward remarked that he had said over and over again that there was no such thing as giving a client a rough idea of what a building was going to cost, and the most fallacious way, to his mind, of arriving at the probable cost of a house was by the foot cube, unless the building they were going to erect was precisely like one they had already erected, and unless the labour was the same. Supposing in the intervening period the ca' canny method arose to lay not 400 bricks per day but 20 (laughter). Young architects could not do it, but as they got older they could tell their clients distinctly, "If you want a rough idea, a real idea, of what this building is going to cost, you must employ a quantity surveyor to take out quantities. You must pay for that. In the event of your saying you cannot afford to put up the building you have to pay for those quantities."

The vote of thanks was heartily accorded, and was briefly acknowledged by Mr. Paull and Mr. Done.

THE WEEK IN PARLIAMENT.

Westminster, *Wednesday.*

Housing.

Sir Kingsley Wood, in advocating a spirit of co-operation, pointed out that during last year 77,000 houses were built, which was more than the annual average for the last ten years before the war. That was not a bad start. This year the Director-General of Housing had stated that 105,000 houses would be built. Referring to the Prime Minister's statement that the Government were going to build houses for £500 and let them at 9s. a week, he said that from inquiries he found that the recent tender price in London was £625 per house. A £500 house, with from eight to ten houses to the acre, would require 25 per cent. of that sum for roads and drainage, and, therefore, these houses would have to be erected at less than £400 each. He refuted the suggestion that the cost of land sent up the price of building. If the Prime Minister was going to continue the policy of subsidies he had some dangerous enemies. Directly the subsidy policy was embarked on under the Addison scheme, prices rose almost in a night from £350 to £800 or £1,000, and he could not see how, with millions dangled before both employers and employed, they were to escape sky-scraping prices. As to dilution, an agreement on that question ought to have been come to long ago, and no trade had a right to take up a selfish attitude. The building operatives were asked to build houses, not for people in Park-lane, but for their fellow workmen.

Mr. P. Harris, a Liberal, suggested that the only way to solve the problem was to put forward a seven years' programme, and Mr. George Edwards, from the Labour benches, expressed profound disappointment at the Government proposals from the rural point of view. Mr. Ayles, another Labour member, alleged that the price of bricks rose from 65s. to 72s. 6d. a thousand directly it became known that a Labour Government was coming into office and was going to tackle the problem in a determined way.

Mr. Clynes, the Lord Privy Seal, defended the Government's proposals. Lieut.-Col. Fremantle, a Unionist, and former Chairman of the L.C.C. Housing Committee, while agreeing with any steps which might be taken to prevent trusts and rings, pointed out that profiteering was not all on one side. The Government should consider the question of output as well as that of profit.

Asked by Mr. D. G. Somerville if, in view of the promotion of employment, he would inquire into the various trade union regulations governing the number of apprentices who might be trained, and whether he had any information that the existing regulations prevented the extended technical training of the young, Mr. Shaw said that the cases in which the proportion of apprentices allowed was definitely laid down by trade union rules or by agreements between trade unions and employers' associations were not numerous. The matter was largely governed by unwritten practice, and an inquiry into this would be laborious and not likely to produce useful results. He had no reason to suppose that trade union rules as to the number of apprentices prevented the extended technical training of the young, and he might add that in one case in which the small number of apprentices was at present a source of serious difficulty, viz., in the building trade, the actual number according to his information was below that recognised by both employers' and workers' organisations as adequate to the needs of the trade.

The Subsidy.

Mr. Wheatley informed Mr. Raynes that in cases in which he was satisfied that builders, on the faith of assurances given by or on behalf of local authorities, had proceeded with building in anticipation of the approval of the local authorities' scheme for assisting grivate enterprise the equivalent of the Government grant under the Housing Act would be paid in respect of houses which would otherwise be eligible for assistance.

BOOK REVIEW.

Manual of Information on City Planning and Zoning. By Thedora Kimball. (Harvard University Press. 1923). Price 16s. net.

No one is likely to realise more than the librarian the need that undoubtedly exists for the classification of information on the subject of town planning, and, as librarian to the school of Landscape Architecture, Harvard University, and Hon. Librarian, American City Planning Institute, no one is better able to give this in concise form than Miss Thedora Kimball. Her work in all fields of city planning is well known in the States, and this useful manual is but another proof of her deep interest in the subject.

In the introductory chapter on the principles and procedure of town planning she emphasises the need of outside expert advice in the development of the city plan—"The problems of a city are so complicated that the local city planning commission can hardly be expected to arrive at comprehensive solutions unless it employs outside assistance." The city planning commission having been appointed, and having begun its work with the aid of technical advice, the next step, as Miss Kimball points out, is to inform the public thoroughly concerning the value of city planning and what it can do for the development of the city. Valuable suggestions on conducting publicity campaigns are given, "no group of citizens and no section of the locality should be overlooked." "Citizens and taxpayers alike have something to gain from the adoption of a comprehensive city plan, and every one of them, however obscure or modest, is worth reaching." Securing newspaper aid, enlisting support of local clubs, enrolling business organisations, convincing municipal officials, educating future citizens, are a few of the suggestions put forward under this heading. Town councils and Regional committees in this country have much to learn from American town planning work, and from Miss Kimball's book.

The greater part of the book is, of necessity, a catalogue of the bibliography on the subject and it must come as a surprise to many that in the comparatively short time town planning has been a science, so vast an amount of literature has been written on the subject.

Many pages of the book will, no doubt, be of great use to American citizens and town planners on the services performed by the various departments dealing with housing and building; there is also included an interesting chapter on city planning progress in the United States and other countries. In short, Miss Kimball has contributed an "enquire within" on everything relating to city planning in the United States and unlike most "enquire withins" appears to have omitted nothing.

THE BUILDING TRADE.

TRADE UNIONS AND EMPLOYMENT.

In these days of rivalry between trade unions a further complication has arisen in connection with employment, and a recent decision in the case Reynolds *v.* Shipping Federation (1924, 1 Ch. 28) is of interest. In the judgment in that case the following passage occurs: "For many years past no one has questioned the right of a trade union to insist, if they are strong enough to do so, under penalty of a strike, that an employer or group of employers shall employ none but members of the trade union."

Trade unionists have fought for that principle for years and as the above passage shows it has generally been accepted, as we think, mainly on the ground that there are advantages to both sides in collective bargaining. But of late years unions relating to the same trade have multiplied and there are more than one union representing men in similar employment, and an example of this was before the public eye recently in the case of the National Union of Railwaymen and the Associated Society of Locomotive Engineers and Firemen, although there are many other examples. The question therefore arises: what is the position of the employer as regards men who belong to different unions relating to the same character of employment?

The facts in the above case are somewhat complicated, and we will briefly indicate them as they bear upon this question, but it is necessary first to take from the judgment a short history as to how the position arose. In 1917, during the war, the Ministry of Shipping set up an organisation for the purpose of enabling shipowners to obtain crews without difficulty, of removing causes of friction and of enabling questions between employer and employed to be settled promptly and effectively. On this organisation, the National Maritime Board, apparently all interests were represented—the shipowners by the Shipping Federation; the masters by three societies; the marine engineers by two societies; the navigating officers by three societies; the sailors and firemen by the National Union; and the stewards by a union of their own; and the independent chairman was the Parliamentary Secretary of the Ministry of Shipping. This Board appears to have succeeded admirably and it inaugurated a successful scheme embodying for the first time in that industry collective bargaining. After the termination of the war the Ministry withdrew, but in view of the advantages that had resulted both the Ministry of Reconstruction and the Ministry of Labour urged the shipowners to keep the Board in existence and in 1920 it was reconstituted, and without entering into detail it appears that all interests were again represented much as before and that the organisation worked smoothly down to the present time.

But in 1921 the seed of trouble was sown in a manner very instructive in connection with the recent dispute on the railways. In that year a question arose in connection with a demand by the employers for a reduction of wages, and after some negotiation this was settled by all the bodies concerned with the exception of the Stewards' Union, the members of which struck. After the termination of the strike this union withdrew from the National Maritime Board and in 1922 a new union was formed called the Amalgamated Union, by the amalgamation of the Stewards' Union with a small union at Southampton called the British Seafarers' Union. Whether this latter body had at any time been represented on the Board is not stated in the Report, but the Amalgamated Union, after that date, was in rivalry with the National Union and never became a member of the Board, and never officially recognised its decisions. With the institution of this separate union we now come to the point directly raised in the case. The Shipping Federation seeing that if any considerable number of the men employed belonged to the Amalgamated Union they would not be bound by any decision of the National Maritime Board, and collective bargaining would be at an end, made an arrangement that the supply of men should be made through the National Union and that for this purpose every man engaged should produce a card stamped by the National Union. It does not appear that every man should necessarily be a member of that union, but it was assumed only men should be sent who would be bound through their representatives by the decisions of the National Maritime Board.

The plaintiff in this action had at one time been a member of the National Union, but had some time back ceased to contribute to it, and in February, 1923, had become a member of the Amalgamated Union. His employment was a greaser in the engine room. This man had applied to the second engineer of a ship lying in the London Docks for employment, and the second engineer, who had had experience of him as a reliable man, told him to attend the next day to pass the doctor and sign on. When he so attended the delegate of the National Union employed at the docks for the purpose of seeing that the arrangement mentioned above was observed raised the objection that he had not the card required issued by the National Union. He was offered the opportunity of rejoining the National Union or rejoining on paying up arrears and thus obtaining a card, but he declined to do so and the second engineer thereupon declined to take any further steps to engage him. The plaintiff brought this action against the Shipping Federation, the National Union and their President, and the port delegate, alleging that the acts and conduct of the defendants constituted an unlawful conspiracy to prevent him from obtaining employment in any ship under the control of the Shipping Federation, and claiming a declaration that he was entitled to employment on any ship without being a member of the National Union or possessing the card in question.

There were other points in the case, but this is the issue we are concerned with. The Court distinguished the cases Temperton *v.* Russell (1893, 1 Q.B. 715), and Quinn *v.* Leatham (1901, A.C. 25), on the ground that the agreement or combination here was not against a particular individual, but merely operated to exclude such individuals as might not from time to time satisfy a qualification which was within the reach of anyone who desired employment; the exclusion was against a class, and that a class to which anyone at any time might cease to belong; and the motive was not a malicious desire to inflict loss on any individual, or class of individuals, but only a desire to advance the business interests of employer and employed alike by securing or maintaining those advantages of collective bargaining or control which had been experienced since the institution of the National Maritime Board, and in this respect the case came within the principle laid down in the Mogul Steamship Case (1892, A.C. 25).

In the judgment occurs the passage we set out at the beginning of this article, that it has long been recognised that a trade union can insist that an employer shall employ none but members of a trade union, and the judgment proceeded to point out that the result of any such effective combination of workmen has been to impose on other workmen the necessity of joining the union as a condition of obtaining employment, and that in this case all that the employers had done was voluntarily to adopt the system which could have been enforced upon them of employing only men belonging to the trade union, and that the incidental result to other workmen in the trade was the same as if the employers had yielded against their will to accept the trade union practice. In other words, the Court held what was sauce for the goose was sauce for the gander.

It must be noted that it was held in this case that there was no malicious or capricious intention by the agreement to injure an individual or a class, the agreement being made solely to advance business interests as in the Mogul Steamship case (*ubi sup*), and it also falls within the principle laid down by the House of Lords in Allen *v.* Flood, that every workman has the right to exercise his option as to whom he will work with. That case and Quinn *v.* Leatham will be found discussed in *The Builder*, April 4, 1913. The importance of the case is that it applies this doctrine as reversed in the case of employers and explains what may be their position where without malicious intent but to further the interests of trade they may be confronted with the claims of rival unions.

At the present time there is a tendency among trade unionists if they dissent from the advice given by their leaders, or if they in a minority disagree with an award made by a tribunal before which they have been represented, but which is not binding in law, to withdraw from that union and form another which will represent their independent views, and such action must place employers in a position of great difficulty. If they continue to take men from the union from which the men in a minority have seceded, difficulty may occur with the union formed by the minority (the case of Allen *v.* Flood only turned upon a dispute between two unions, the Boilermakers objecting to work with the Shipwrights), and the multiplicity of unions must injure trade and inflict loss on both employer and employed; it also strikes at the root of the main principle of trade unionism—collective bargaining. This is a matter deserving the most serious attention of the Trade Union Congress and the present decision serves to show that what is considered reasonable action on the part of the men in selecting with whom they will work applies equally to the action of employers as to whom they will employ, but the action of both bodies has to be kept within reasonable limits. Conspiring, malicious action, the victimisation of individuals or classes, is not tolerated on either side.

DILUTION IN THE BUILDING TRADE.

In the course of a letter to the *Times*, on this subject, Mr. John Coleridge, F.R.I.B.A., states: "There is one method of solving the question of dilution of labour and apprenticeship in the building trade, which go together, that has not, so far as I am aware, been suggested.

"The first difficulty is to get the masters to apprentice grown men, because they want something to live on during their apprenticeship. I venture to suggest that during an apprenticeship of, say, two years, the present amount of the dole should be paid to the master on the production of his apprentice's receipt for his week's pay of an equal amount or more. This would ensure that a man did his work and got his pay, and it would no longer be a dole for doing nothing, but an honourable subsistence allowance while learning his trade. It could be worked through the Labour Exchanges with little trouble.

"The unions will say it takes five years to make a bricklayer, but no person of sense who handled men during the war will believe it. They learned! It is not as if the standard of craftsmanship was universally high in the unions. I would set no limit to the age of an apprentice. Why should a man be debarred from learning a trade because he has more sense than a boy? The present tyranny of the building trade unions is ridiculous and contrary to public policy when houses are so badly needed, and the present Government will deserve badly of the great class of people who need homes and the great class of decent unemployed if they allow it to go on."

HOUSING AND RECENT LEGISLATION.

On February 7, Mr. T. P. Bennett lectured before the Northern Polytechnic Institute on this subject.

In the course of his remarks he said the subject of his paper was one which had given rise to an extraordinary amount of controversy, and dealt with problems which were hedged around with quite unusual difficulties. In the first place it was necessary to study the reasons which had necessitated legislation in connection with such a perfectly simple and straightforward subject as the building of houses. If every person were now paid, and had always been paid, wages which enabled them to support themselves in a satisfactory residence, there would be no need for discussion on housing or for special legislation.

The next section of their subject which needed consideration was the reason for the introduction of legislation. In the first place the constant migration of country people to the towns had outstripped the supply of houses to a surprising extent, and if means of cheap transport had not simultaneously developed their present position would be infinitely more serious than it was. Transport, however, was comparatively new, and it was only beginning to have an extensive influence on the solution of the housing problem. Legislation had also been attempted by groups of sociologists who had endeavoured, by various means, to improve the lay-out of their towns, to raise the standard of accommodation provided in their houses, and to find ways and means of replacing the assistance which was formerly given by the landowners in housing their employees. Finally, they got a great crop of legislative efforts coming directly from the artificial conditions created by the war, conditions which were partly the result of the complete cessation of building, partly the desire to help the returning members of their civilian armies, and partly a desire to create satisfactory and healthy conditions of living for the whole of the community.

The third, and most important, division of the subject was the consideration of the legislation which had actually taken place in recent years.

The first Act of Parliament which demanded attention was the Finance Act of 1909-10, usually referred to as the Lloyd George Act. This Act, as they were probably aware, gave rise to an enormous amount of controversy, and in 1922 was repealed. It was important that they should examine the object which it had in view, and the actual result of its passage into law, because it showed, on the one hand, that incomplete knowledge might lead to entirely fallacious reasoning, and, on the other hand, that results might accrue which were absolutely contrary to the intentions of the promoters.

The most surprising feature of the Act was the disastrous effect it had upon building. Before the Act was passed a large amount of housing development was taking place, principally through the agency of the speculative builder. Investigation which was subsequently made proved that the builder drew his profit more from the increased value of the land than from the houses erected thereon, so that as soon as a large part of the increased value of the land was taken away from him he was unable to build.

In 1909 the Town-Planning Act was passed. This was another Act dealing with housing which had been the subject of considerable criticism. Its main provision dealt with the restriction on the number of houses per acre of developed housing land, which was to be 8 for rural and 12 for uburban districts.

The Rent Restriction Act was undoubtedly a wartime necessity, but as time went on and building costs increased, the Rent Restriction Act stood still and created an entirely erroneous idea of the value of building or its relation to the cost of living. In 1920 building prices were over 2¼ times pre-war, while the Rent Restriction Act limited the increase of rent to 40 per cent. above pre-war. It was argued that, although the price of building had increased to this extent, the price of existing houses remained the same.

The cost of the work carried out under this Act was so great that, after being in operation for 18 months or so, the whole of the country realised that it must come to an end or we should be bankrupt.

They then experienced the drastic attempts of Sir Alfred Mond to arrest the scheme. Housing contracts were cancelled, attempts were made to re-sell land, grants were stopped, and, in short, an entire reversal of the previous policy took place. Building, in common with other prices, fell rapidly and continuously until the first few months of 1922 when something like stable conditions began to reappear. In 1923 the Rent Restriction Act was renewed, many of them thought to the detriment of housing development. Much of the fear expressed at the possibility of its removal was, he was certain, unfounded. The immediate effect of removal would not necessarily have meant a substantial increase in the rent of existing houses, and it would have created an enormous amount of confidence on the part of those whose business it was to develop housing.

The year 1923 also saw the introduction of still another Housing Act, and further provisions for the payment of subsidies or contributions upon the part of the Government to those who proposed erecting houses. This time the grants were made on a much more conservative basis, and local authorities were given power to make those grants under various headings, as follows:—

(*a*) A lump sum grant per house.

(*b*) An annual payment for a period of not more than twenty years to the person by whom the rates were payable.

(*c*) Periodical payments to a building society or other body or person (including the local authority) of a part of the amounts due in respect of interest and redemption charges on advances made for the building of a house or for the purchase of a new house, the building of which within the prescribed period was approved by the local authority.

He had been informed by the Ministry of Health that approval had been given under the 1923 Act for the erection of the following:—

33,782 houses by local authorities.
60,280 houses by private enterprise.

This seemed to him a surprisingly satisfactory result considering the short time during which the Act had been in operation, and he thought it was particularly advantageous to find that over 60,000 houses had already been erected by private enterprise.

Sir Charles Ruthen, the Director-General of Housing at the Ministry of Health, had stated that the houses authorised under the 1919 Act were now practically completed. The total number erected under that Act, and under the Housing (Additional Powers) Act of 1919, would reach approximately 220,000. During the year ended September 30, 1923, 77,630 houses were completed, of which 25,289 were built by local authorities and 25,350 by private enterprise; of the latter, 39,150 were houses not exceeding an annual rateable value of £26; 11,550 had a rateable value of between £26 and £52, and only 1,650 had a rateable value of between £52 and £78. The majority of the dwellings erected by private enterprise were "five-roomed" houses.

In referring to the great shortage of skilled labour in the building industry, Sir Charles Ruthen drew attention to the fact that the numerical strength of the operatives has decreased by 50,000 in the last 12 months.

These were the principal Acts which had become law, but it was extremely valuable to consider various suggestions for legislation which had been discussed from time to time.

The most important of those proposals was the Compulsory Enfranchisement of Leaseholds. As they were probably aware, the system of granting leaseholds which was so common in London and in many other districts in England, had frequently been the subject of attack, mainly because there appeared on the face of it to be a certain amount of injustice for one man to build a house and another man, at the end of the lease, to acquire possession of it without payment.

There were certain advantages of leaseholds which were more apparent to the independent observer than to a person with an active interest in property. For example, the examination of a number of cases proved that the state of repair of leasehold property was, on the whole, considerably above that of similar freehold property, particularly with regard to small houses. It also transpired that the granting of leases more or less ensured the rebuilding of property once every 120 years or so, so that there was a constant tendency to destroy obsolete and unsatisfactory houses and to replace them with modern houses suitable to the new environment and to the changing ideas of the public. The leasehold property was much more certain to be brought up to date than freehold property, and although this might be disadvantageous to certain individuals, it is undoubtedly beneficial to the community.

The next proposal, which was of long standing, and had recently been revived, was the taxation or rating of vacant building land. This had some sort of analogy with the proposals of the Lloyd George Act of 1909, which endeavoured to secure the increment value of building land for the supposed benefit of the community. It was open to the grave objections which had actually occurred in the previous case, and which eventually led to the repealing of the Act.

The recent legislation in connection with finance had, by creating a high Income Tax on unearned income, taxed ground rents much more heavily than any proposal to levy upon them a charge for the local rates, and in some cases 25 per cent., in other cases as much as 60 per cent., of the ground rent was now taken by the Exchequer.

A further proposal had been made that empty houses should be taxed or rated, with a view of inducing the owners to let. Here they were on ground which was extremely difficult because if, as some asserted, houses were purposely kept on the market in order that a high rent might be obtained, it was purely an incident in the progress of the housing problem. In pre-war days roughly 10 per cent. of the houses in the country were permanently vacant, and this was quite a big enough margin to keep rents constantly at the lowest possible figure.

It would be seen that since 1909 a large number of efforts had been made to solve the housing problem or to solve sections of it by means of legislation. One of the primary difficulties of the whole question was the fact that they were still living with the tradition of uneconomic rents created in the days when we were primarily an agricultural people.

The great ally of the town-planning scheme was the development of transport, and the solution of the housing problem was undoubtedly closely connected with this very important factor in modern life. Without transport they could not solve the housing problem.

In conclusion, Mr. Bennett said the study of legislation on housing was extremely involved, very extensive, and by no means easy. He had endeavoured to indicate briefly the directions in which past legislative efforts had been made, and to refer to their results. He sincerely hoped any future legislation would not be taken in hand without very full and complete consultation with those professional and business men who had had to deal with the problem of the erection of economic houses.

NATIONAL FEDERATION OF BUILDING TRADE EMPLOYERS.

Annual Dinner.

Mr. W. H. Nicholls (President) occupied the chair at the annual dinner of the National Federation of Building Trades Employers of Great Britain and Ireland, held at the Hotel Victoria, Charing Cross, on Tuesday last. Some 300 members and guests were present, including Mr. Henry Matthews (Senior Vice-President), Mr. E. J. Partridge (President, Society of Architects), Mr. A. J. Forsdike, Mr. John M. Theobald, F.S.I., Mr. John Good (Past President), Mr. James Petrie (President, Institution of Structural Engineers), Mr. W. T. Nicholls, Mr. Jno. Croad, Mr. Fred G. Hodges (Hon. Treasurer), Mr. E. P. Bovey (President, South-Western Federation), Mr. F. R. Ackroyd, Mr. J. M. Macfarlane (President, North-Western Federation), Mr. G. A. Hewitt (President, Midland Federation), Mr. W. C. Walker (President, South-Western Federation), Mr. J. Carse (President, Northern Counties Federation), Mr. I. J. Chorley (President, South Wales Federation), Mr. G. A. Coulson (President, National Association of Shopfitters), Mr. S. Smethurst, Mr. J. P. Cox (Vice-Chairman, National Allied Building Trades Employers), Mr. C. E. Campbell, Mr. W. Scott (President, Institute of Plumbers), Mr. J. E. Chadwick (President, National Association of Master Plasterers), Mr. G. A. G. Robertson, Mr. W. Sharratt, Mr. Stanley Miller, Mr. Henry T. Holloway (President, London Master Builders' Association), Mr. Roland B. Chessum, Mr. Frank Cowlin, Mr. C. H. Long, Mr. E. Quibell, Mr. B. Talbot, Mr. T. Howarth, Mr. J. H. Barker, Mr. G. A. Hotter, Mr. E. J. Strange, Mr. R. A. Costain, Mr. J. G. Mallett, F.S.I., Mr. G. J. Aldous, Mr. E. C. Desch, Mr. A. J. Thomas, Lic.R.I.B.A., Mr. P. C. Culver, Mr. A. H. Adamson, Mr. G. S. Roberts, Mr. A. B. Falkner, Mr. A. J. Thomas, Lic.R.I.B.A., Mr. M. W. Matts, Lic.R.I.B.A., Mr. R. J. Senecal, A.R.I.B.A., Mr. F. Thorne, Mr Ernest J. Brown (Director of the London Master Builders' Association), Mr. G. M. Burt, Mr. R. J. Holliday, Mr. F. W. Loasby, Mr. P. W. Cox, Mr. F. H. Smith, Mr. A. S. Grunspan, A.M.Inst.C.E., Mr. L. Stanley Crosbie, F.R.I.B.A., Mr. A. G. White (Secretary), Mr. F. A. Wall (Assistant Secretary), Mr. A. Legge, J.P. (Organiser), and Mr. W. J. Rudderham (Secretary, London Master Builders' Association).

After the loyal toasts had been honoured, Mr. B. Matthews proposed "The Architects and Surveyors." In the course of his remarks he said that toast was a very important one, and they were very glad to have architects present on that occasion. Builders were always very pleased to meet architects—in fact, it was their business to do so! But they always had in mind that there were architects and architects—some architects, fortunately very few, might be put on a "black list," and builders warned to have nothing to do with them; they were, however, very pleased to be associated with the majority of architects in the erection of the wonderful modern buildings which were being built. He thought architects might very well form a "Committee for the Removal of Signs on Buildings and Other Monstrosities," a committee for the refinement of public taste, and to bring into the minds of the public a better conception of the beautiful. They might also have a publicity committee through which architects could draw public attention to some of the things which disfigured the beautiful city of London. What a monstrosity was that bridge at Charing Cross—however could any community ever have permitted such a thing to come into existence? Why it should be permitted to continue passed the comprehension of all who had any thought and consideration for the amenities of London. They looked to architects to be censors of anything of that kind, to agitate for the removal of existing monstrosities, and prevent the erection of such things in the future.

In responding for the architects, Mr. E. J. Partridge congratulated Mr. Matthews on the fact that he would shortly be taking the office of President of the Federation. The signs which disfigured so many buildings in London offended the eyes of architects as much as the eyes of builders, and he was hopeful that the Fine Arts Commission which had been set up recently—partly through the offices of the Society of Architects—would have a good effect in that direction; they would all like to see those horrible signs done away with. With regard to a publicity campaign with the object of removing the signs, he thought such a proceeding was highly undesirable, because it was exactly what the owners of the signs wanted; he would certainly like to see them done away with, but with as little publicity as possible.

Mr. J. M. Theobald responded on behalf of the quantity surveyors.

The toast of "The National Federation of Building Trades Employers was proposed by Mr. John M. Macfarlane, who said the North-Western Federation had done a great deal for the building trade, and, incidentally, for the public. In the past builders were generally forced to sign a form of contract which was nothing less than a surrender of soul, but owing to the energies of the National Federation that was a thing of the past. Owing to the efforts of those who comprised the National Federation, that time was past and they had now obtained at least an equitable form of contract. Sometimes, however, they found the equity was seasoned with other qualities, and that the equity had almost disappeared, and their rights had disappeared in their obligations. But they were making progress, and they trusted the day was not far distant — in fact, he thought that day had actually dawned—when they would have a form of contract which would leave nothing to be desired on the part of the building owner, architect, or the builder. The Federation had dealt with many other things besides the form of contract. It had carried out negotiations with the operatives, and they now boasted of possessing an organisation which could meet the operatives on almost equal terms. Perhaps it was not too much to hope that with the perfecting of the organisation at no distant date they would find the operatives and employers meeting on equal terms. The Federation had been of benefit to the building owner, the architect, and the quantity surveyor, as well as the builder. The present position of the Federation had entailed a great deal of work, and the industry was enormously indebted to those who had borne the major portion of that labour. In conclusion, he paid a tribute to the work of Mr. Nicholls during his term of office.

In responding, Mr. Nicholls thanked those present for the way in which they had received the toast. The Federation had, he said, difficult times in front of it in the near future. The most difficult problem at the present moment was that of attempting to make the small amount of labour they had at their disposal meet the enormous demand on the industry of the country. The difficulty at present of solving the labour problem would require all the assistance the Federation could give to its members, and the Federation was determined, so far as lay within its power, to meet the case both now and in the future. The Federation realised that only by doing that could it rightly perform its functions; with the co-operation of every one of its members the Federation would do its utmost to meet the difficult position now confronting it. Touching on the housing problem, he said the builders were not behind any other members of the community in their sincere desire to see that the housing needs of the country were met. Hitherto they had carried that responsibility for the community, and but for the interference of statesmen who did not know the serious issues they were playing with, the building industry would have met it up to to-day. The only thing which prevented builders from providing houses was that politicians interfered with businesses they did not understand. The country needed houses, and the industry was going, at great cost if need be, to meet those needs. They believed that the socialisation of the industry was the wrong way to meet the case. As a Federation it stood for every one of its members having complete liberty to carry on his business. The housing problem could best be met by private enterprise. They also believed that the whole of the industrial needs of the country, which called for factories and other buildings, must go forward at the same time as the building of houses. To attempt to shut down the industrial and commercial requirements of the country in order to allow the housing needs to be met was not a method which the National Federation would approve. They agreed that houses were necessary, and were prepared to do all in their power to build them, but other work must not be stopped in order to allow houses to be built. All types of buildings were necessary for the proper development of the country, and the Federation said with no uncertain voice that workers should not be withdrawn from commercial buildings and transferred to housing. There were workers and materials for the better class of work, but the situation would not be met by closing down one class of work in order to proceed with another.

The toast of "The Ladies" was proposed by Mr. A. J. Forsdike and responded to by Sir H. McLaughlin.

"Our Guests," proposed by Mr. Fred G. Hodges, was responded to by Mr. C. E. Campbell and Mr. W. Scott.

PAINT IN WINTER.

It is of interest to note that the National Federation of Associated Paint, Colour and Varnish Manufacturers of the United Kingdom has taken energetic action in regard to the question of painting during the current year.

It is rather surprising, in view of the fact that surfaces, if painted in time, have very much longer life, that a false economy of delay is so often practised.

There is a saying "It is not worth while spoiling the ship for a ha'porth of tar." Apart from the question of tar, however, the majority of ship-owners are seldom guilty of spoiling their ships for the lack of paint. It is usually a question of paint, paint, and yet more paint. On the other hand building owners do not always seem to realise the ultimate economy of a protective coat of paint on ironwork.

If all master painters, decorators, and others interested co-operated in urging the public to put painting work in hand in winter, both the decorators and the public would be benefited. After all, there is no logical reason why, from a strictly utilitarian point of view, 50 per cent. at least of painting should not be done in the winter. Better results can usually be guaranteed now than later on in the year when trade is so much busier.

Is the attitude against painting in the winter a question of "prejudice"?

House Building in Vienna.

The Vienna Corporation has decided to build 5,000 houses annually for five years, and private initiative is also to the fore. For the latter "every man his own house" seems to have become the accepted motto, and the idea is being realised, both in rows of houses, semi-detached or double houses, and one-family houses. For the advancement of this movement the Government and the city of Vienna have granted a credit of 60,000,000,000 Austrian Kr. Legislation is gradually being modified so as to remove existing impediments for national evolution.

THE SCOTTISH BUILDER

HOUSING IN SCOTLAND.

THE number of houses completed in Scotland at the end of last year numbered 21,087 under the Act of 1919; under the private subsidy scheme, 2,319; under the slum clearance scheme, 208. The houses under construction were 2,914; and under slum clearance, 1,143. Capt. Walter Elliot, late Under Secretary to the Scottish Board of Health, has, in a letter to the press, analysed the financial side of the Government's new housing proposals. The rent at which houses are to be let is now given at 9s. a week, inclusive of rates, which for Scotland works out, less rates, at about £15 12s. a year. Such a house costs £500. The debit balance would thus demand a subsidy of approximately £20 a year for sixty years. The annual payment would be £30, or a total expense of £600, equal to a cash-down payment of £378 a house. Captain Elliot regards the new proposals as contemplating a payment per house, five times greater than that approved of last year. "It has been suggested that two million houses are to be built. This means an annual addition to the taxes of forty millions a year for sixty years, or sixty millions for twenty-six years."

Mr. Climie, Socialist M.P. for Kilmarnock, said recently in the House that he hoped that the Minister of Health and the Secretary for Scotland would make it plain that they were not going to allow houses to be built of a smaller size than two bedrooms, a living room, a kitchen, and a bath-room. Doubt had been thrown on the Prime Minister's statement that it was intended to build houses at £500. That it could be done he knew from personal knowledge. The last contract given this year in Kilmarnock was for thirty houses, eighteen of them with three bedrooms each; and twelve with two bedrooms each, with living room and scullery. The average price for these houses in open contract was £440 "all in." They were being built by a private builder on the £6 subsidy, and the Council had been able to fix rents of £24 for the three-roomed houses, and £27 for the four-roomed houses. At this rate they had been able to bring out a balance sheet showing that they would lose only £12 13s. 5d. a year on the thirty houses for the first twenty years. At a conference in Edinburgh on housing, with one or two exceptions, the delegates were in agreement in urging that two-apartment houses were requisite in existing circumstances, and that a density of 24 houses to the acre for slum reconstruction schemes was too low. Examples were given to show that the density of some areas which were being cleared now was up to 200 houses to the acre. These houses were meant for old-age pensioners, single women, and young married couples without families. Sir Henry Keith pointed out that £500 houses, to be let at 9s. a week, inclusive of rates, which, according to the Prime Minister, was to be the key of the Government's housing policy, would involve a subsidy of £20. Mr. Stewart, Under Secretary for Health, said that 51 per cent. of the total houses in Scotland were one or two-apartment houses, and that 47 per cent. of the population were living in these houses. Councillor Allan pointed out, after the conference, that, if a three-roomed scheme is insisted on, it means that the loss will run to from £12 to £15 a house per year, for twenty years, to be paid by the community.

HOUSING STANDARDS.

ON February 18, Dr. A. K. Chalmers, Medical Officer of Health, Glasgow, lectured at the Goldsmiths' College Lecture Hall, New Cross, on this subject. Sir William J. Collins, Chairman of the Chadwick Trustees, was in the chair.

Dr. Chalmers, in the course of his lecture, contrasted housing customs in England and Scotland, and referred to the initial difficulty in use of terms. A tenement in Scotland was usually a building of three or four stories, with each floor divided into two or three or more houses; in England, as a rule, the terms were reversed—the whole building was the house and the separate occupancies were the tenements. As a common term, the house might be regarded as the accommodation required for home and family life. When this complex was broken and the house was "made down" to accommodate several families, the primary services—water supply, drainage, ventilation—originally designed for one family, were all modified and frequently impaired. As a rule, the house in England had more rooms than the house in Scotland, but the rooms of the house in Scotland tended to be usually larger. The one-apartment house was a common feature of Scottish housing. It combined the functions of the living-room, scullery and bedroom. Sculleries were not common in small houses in Scotland until recent housing schemes.

As to the question of standards, the Housing Acts and building regulations defined them in a degree. The primary requirements of healthy housing were obviously a pure water supply and an adequate system of refuse removal. Absence of these was commonly associated with other defects in the construction of the house, its design and relationship to other buildings. The Housing Act of 1890 focussed and amplified earlier legislation. Building regulations were complementary to the clearance of insanitary areas. Among other purposes they were intended to prevent over-building of sites and to provide free circulation of air and adequate lighting of rooms. The width of the street in relation to height of buildings facing it was an important factor.

The inflexibility of building regulations was often a drawback, and the desire in New York to adapt them to the needs of particular areas by a system of "districting" showed that this was the case in other countries as well as here. The orientation of streets in relation to available sunlight was an important feature of town planning. There was an advantage in streets running diagonally with the cardinal points of he compass.

NEW BUILDINGS IN SCOTLAND.

Glasgow.—HOUSES.—The Corporation has been recommended to accept tenders for the erection of houses at Crossmyloof, at a total cost of £67,256, and also at Whitefield-road and Brand-street, Govan, at a total cost of £41,127.

Johnstone.—HOUSES.—The T.C. is forwarding a proposal to the B.H. which it has under consideration, for the erection of 100 houses.

Alloa.—HOUSES.—The Dean of Guild Court has passed plans for a house in Queen-street for Mr. W. McMillan, Calcutta, and for four blocks of houses at Ashley-terrace, for the T.C. Each block consists of four houses.

Ayr.—HOUSES.—The Dean of Guild Court have passed the following plans:—R. W. Hutchison, builder, two houses in Falkland Park-road, at a cost of £1,200; H. H. Mills, house at Doonfoot-road, at a cost of £1,600; Quintin Clark, joiner, two houses at Bellesley-hill-road, at a cost of £1,490.

Bridge-of-Allan.—DWELLINGS.—The T.C. has passed plans for alterations at Craigievar, Henderson-street, submitted by Bell & Harvey, architects, Stirling. The building will be converted into two dwellings.

Aberdeen.—BATHS.—The T.C. has passed plans for new buildings, including four houses, and the total estimated cost is £4,500. The Corporation Links and Parks Sub-Committee are to ask for powers to borrow £100,000 for the erection of baths.

Renfrew.—OFFICE.—The B.H. has approved of the plans for the new Board offices.

New Elgin.—HOUSES.—The Moray C.C. has now decided to erect a house for the sanitary inspector at New Elgin.

Lochgelly.—HOUSES.—Various works required in erecting 40 houses at Dundonald, for the Lochgelly Iron & Coal Co., also for forming a new street there. Schedules can be obtained from Mr. A. D. Haxton, architect, Leven.

BUILDING TRADE WAGES IN SCOTLAND.*

THE following are the present rates of wages in the building trade in the principal towns of Scotland. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur:—

	Masons.	Brick layers.	Carpenters, Joiners.	Plasterers.	Slaters.	Plumbers.	Painters.	Brick-layers' Labourers.	Masons' Labourers.	Plasterers' Labourers.
Aberdeen	1/7½	1/8½	1/7½	1/8	1/7	1/7	1/4½		1/0½	
Airdrie	1/7½	1/7½	1/7½	1/8	1/7	1/7	1/6½		1/2½	
Alexandria	1/7½	1/7½	1/7½	1/8	1/7	1/7	1/6½		1/2½	
Arbroath	1/7½	1/6½	1/6½	1/7	1/6	1/6	1/5		1/1½	
Ayr	1/7½	1/7½	1/7½	1/8½	1/7½	1/7½	1/6½		1/2½	
Bathgate	1/7½	1/7½	1/7½	1/8	1/7	1/7	1/6½		1/1½ to 1/2½	
Blairgowrie	1/7½	—	1/7½	1/7	1/7	1/7	1/6½		—	
Bo'ness	1/7½	1/7½	1/7½	1/8	1/7	1/7	1/6½		1/2½	
Coatbridge	1/7½	1/7½	1/7½	1/8	1/7	1/7	1/6½		1/2½	
Dumbarton	1/7½	1/7½	1/7½	1/8	1/7½	1/7½	1/6½		1/2½	
Dumfries	1/5	1/5	1/5	1/6	1/5½	1/6	1/5½		1/1 to 1/1½	
Dundee	1/7½	1/7½	1/7½	1/8	1/7	1/7	1/6½		1/2½	
Dunfermline	1/7½	1/7½	1/7½	1/8	1/7	1/7	1/6½		1/2½	
Edinburgh	1/7½	1/7½	1/7½	1/8	1/8	1/7	1/6½		1/2½	
Falkirk	1/7½	1/7½	1/7½	1/8	1/7	1/7	1/6½		1/2½	
Fort William	1/7½	1/6½	1/6½	1/7	1/6	1/6	1/6½		1/2	
Galashiels	1/5½	1/5½	1/5½	1/6	1/5	1/5	1/5½		1/1½	
Glasgow	1/7½	1/7½	1/7½	1/8	1/7	1/7	1/6½		1/2½	
Greenock	1/7½	1/7½	1/7½	1/8	1/7	1/7	1/5½		1/1½ to 1/2½	
Hamilton	1/7½	1/7½	1/7½	1/8	1/7	1/7	1/6½		1/2½	
Hawick	1/5½	1/5½	1/5½	1/6	1/5	1/5	1/5½		1/2	
Helensburgh	1/7½	1/7½	1/7½	1/8	1/7	1/7	1/6½		1/2½	
Inverness	1/4	—	1/3½	1/4	1/4½	1/4	1/3½		10½d to 1/2½	
Kilmarnock	1/7½	1/7½	1/7½	1/8	1/7	1/7	1/6½		1/2½	
Kirkcaldy	1/7½	1/7½	1/7½	1/8	1/7	1/7	1/6½		1/2½	
Kirkwall	1/7½	1/5½	1/3½	1/4	1/4	1/4	1/4		1/0½	
Lanark	1/7½	1/7½	1/7½	1/8	1/7	1/7	1/5½		1/2½

THE BUILDING TRADE: THE TWO DEMANDS.

Mr. John E. Yerbury, Lic.R.I.B.A., writes :—

SIR,—The article by "A Building Contractor" in your issue for last week strikes a sympathetic note which encourages me once more to return to the question of the revival of the Industrial Council for the Building Industry, with a reformed constitution.

I know I shall be called all sorts of names and be told that I don't know what I am writing about; but I will face that music because the time is opportune, and because I know that your correspondent does not stand alone in the ranks of contractors in his desire to reach a settlement of disputes by saner methods than those of the past.

Notwithstanding the reactionary employer and the revolutionary worker, I feel that the majority (on both sides) desire agreement, and would arrive at a settlement of all disputes if a properly constituted authority could be established by agreement, and in your paper (March 27, 1914) I made a suggestion for the establishment of a conciliation board, with representatives of the public nominated by the representatives of employer and employed.

Since that time I have advocated the taking up of the Foster Report as a basis for discussion (to be told this was arrant nonsense). But if the new Minister of Health is successful in his negotiations with regard to "dilution," and we are to set out on new schemes with guarantees against unemployment, surely it is a good time for men of influence on both sides to try once more the round table conference with the purpose of re-establishing the Building Trade Parliament.

I do not follow your correspondent's figures, but presume he means that having fixed a minimum hourly wage at 10 per cent. higher than the present hourly wage, piece rates are to be fixed for all work; the piece rate to be higher than the time rate in every case. If the cost (labour) is less than the piece rate the difference is to be shared, *i.e.*, the employee would take 50 per cent.; if it cost more the employer would lose.

Example.—Minimum wage 1s. 8d. + 10 per cent. = 1s. 10d. per hour. A piece of work taking average man 12 hours to complete *on present records* would be rated at, say, 10 per cent. on present cost, viz., 22s. + 2s. 2½d. = 24s. 2½d. If completed in 10 hours, the labour cost would be 18s. 4d., a saving of 5s. 10d. on piece rate, of which the employer would receive 2s. 11d. This might add 20 per cent. to 33⅓ per cent. to wages, and at the same time reduce cost to the consumer by 10 per cent. if the whole industry can agree upon *fixed rates for all work.*

The difficulty is to fix a rate in the building trade where men work in gangs, and gangs are frequently broken by one or more men being taken from the particular work in hand. Piece rates are easy enough in the shops, but I have never seen a suggestion which would work in practice on the job.

Except in big business, it is the same with profit-sharing schemes, and even in co-partnership schemes in the building trade only those in constant employ of the same firm—a minority—can share, unless the industry is dealt with as a whole.

A detailed statement of your correspondent's suggestion would be of great interest.

Building Wages.

The National Wages and Conditions Council for the Building Industry, composed of employers and employed, met recently in London to resume discussions on the demand of the operatives for an increase of 2d. per hour in the wages of all workers.

The application was opposed by the employers, and after several hours' discussion the meeting ended without any agreement being reached.

RATES OF WAGES IN THE BUILDING TRADE.

The following are the rates of wages in the building trade in England and Wales. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur :—

	Masons.	Bricklayers.	C'p'ters. Joiners.	Plasterers.	Slaters.	Plumbers.	Painters.	Labourers.
Aberdare	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2¾
Accrington	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2¾
Altrincham	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2¾
Ashton-under-Lyne	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2¾
Barnsley	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2¾

(For rates of wages in the Building Trade in Scotland, see page 314).

CONTRACTS, COMPETITIONS, &c.

For some contracts still open, but not included in this List, see previous issues. Those with an asterisk are advertised in this number. Certain conditions beyond those given in the following information are imposed in some cases, such as that advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in; the name and address at the end is the person from whom or place where quantities, forms of tender, &c., may be obtained.

BUILDING AND PAINTING.

FEBRUARY 23.—**Aberystwyth.**—TWO VILLAS.—Erection of two villas for Mr. T. W. Powell at Brynymor-road, Aberystwyth. Mr. J. Lewis Evans, architect, 21, Great Darkgate street, Aberystwyth.

FEBRUARY 23.—**Bradford.**—HOUSES.—Erection of the following houses in accordance with the conditions stated. Housing Scheme, No. 10, Thornton: 36 houses, Class "A"; 44 houses, Class "B." (1) Contractors may tender for separate trades or for the whole of the work in all trades complete; (2) the tenders shall be based upon fixed prices for labour and materials. City Architect, Town Hall, Bradford.

FEBRUARY 23.—**Crostwick.**—NEW WORKSHOPS.—For erection of new workshops at Stanninghall Farm Colony, for the Norfolk Joint Sanatorium Committee. Messrs. A. F. Scott & Sons, 24, Castle Meadow, Norwich.

FEBRUARY 23.—**Doncaster.**—LOOSE BOXES.—For the erection of 32 loose boxes, &c., on land adjoining Belle Vue, for the T.C. Mr. R. E. Ford, Race Department, 3, Priory-place, Doncaster. Deposit £1 1s.

FEBRUARY 23.—**Ebbw Vale.**—WORK AT SCHOOLS.—For jobbing work at schools for one year, for U.D.C. Mr. P. L. Davies, Surveyor to the Council, District Council Offices, Ebbw Vale. Deposit £1.

FEBRUARY 23.—**Staincliffe.**—PAINTING, &C.—For redecorating inside of chapel and class rooms for the Trustees. Mr. W. Sykes, 11, Hillend-terrace, Killpinhill-lane, near Dewsbury.

FEBRUARY 25.—**Dewsbury.**—PAINTING.—For painter's and decorator's work at the public library and baths, Wellington-road, for the T.C. Borough Surveyor, Town Hall, Dewsbury.

FEBRUARY 25.—**Edinburgh.**—HOUSES.—For erection of following houses, for the T.C.: (1) Gilmerton, 24 houses; (2) Longstone, 4 houses. Messrs. Murray & Baird, 50, George-street, Edinburgh.

FEBRUARY 25.—**Enniskillen.**—BAKERY.—Erection of bakery, for Messrs. G. Whalley & Sons. Mr. J. Donnelly, architect, Enniskillen.

FEBRUARY 25.—**France.**—CEMETERY CONSTRUCTION.—Construction of approximately 30 cemeteries in France. Contract 1924. S. Secretary (Works Dept.), Imperial War Graves Commission, 82, Baker-street, London, W.1. Deposit 15 guineas.

FEBRUARY 25.—**Gloucester.**—SCHOOLS.—Erection of proposed new Northgate Council Schools, for the Gloucester Education Committee. Mr. Walter B. Wood, A.R.I.B.A., 12 Queen-street, Gloucester.

FEBRUARY 25.—**Hemsworth.**—HOUSES.—Erection of 50 houses and the construction of roads and sewers at Grimethorpe, near Barnsley, for the R.D.C. Mr. W. T. Lineham, Architect, Union Offices, Hemsworth, near Pontefract. Deposit £2 2s.

FEBRUARY 25.—**Heswall.**—EXTENSIONS.—For extensions to the Sanatorium, Heswall, for the West Derby Board of Guardians. Mr. Ernest B. Bailey, F.S.I., 9, Cook-street, Liverpool. Deposit £2 2s.

FEBRUARY 25.—**Hindley.**—HOUSES.—Erection of houses on the Housing Site, Atherton-road, for the U.D.C. Mr. O. P. Abbott, architect, Council Offices, Hindley. Deposit £3 3s.

FEBRUARY 25.—**Kirkcaldy.**—HOUSE.—Erection of house for sanitary inspector, for the District Committee. Mr. G. P. Deas, Architect, Central Chambers, Kirkcaldy.

FEBRUARY 25.—**Leith.**—SCHOOL.—For erection of new elementary school, James-place, Leith, for Edinburgh E.C. Mr. J. M. Johnston, architect, 47, Charlotte-street, Leith.

FEBRUARY 25.—**Liverpool.**—ALTERATIONS.—For alterations to operating department, Smithdown-road Institution, for the West Derby B.G. Mr. Ernest B. Bailey, F.S.I., 9, Cook-street, Liverpool. Deposit £1 1s.

FEBRUARY 25.—**London.**—GENERAL WORKS AND REPAIRS.—Execution of general works and repairs (including jobbing works), exclusive of works of a mechanical character, to sewers, engine houses, buildings, bridges, subways, tunnels, &c., under the supervision of the Chief Engineer of the London County Council, on a schedule of prices for a contract for 12 months commencing April 1, 1924 Chief Engineer, Old County Hall, Spring-gardens, S.W.1. Deposit £3.

FEBRUARY 25.—**London, W.**—NURSES' HOME EXTENSION.—Extension of the Nurses' Home at the St. Marylebone Hospital, Rackham-street, W.10, for the B.G. of St. Marylebone. Messrs. Constantine & Vernon, architects, 82, Mortimer-street, W., Deposit two £1 Treasury Notes.

FEBRUARY 25.—**Pontefract**, &c.—ALTERATIONS AND VILLAS.—(1) Additions to their Head Office in Pontefract, for the South Kirby, Featherstone & Hemsworth Collieries Co., Ltd.; and (2) a pair of semi-detached villas, Wakefield road, Purston. Messrs. Garside & Pennington, architects, Pontefract.

FEBRUARY 25.—**Salford.**—HOUSES.—Erection of 38 houses and flats on Littleton-road housing estate, for the T.C. Mr. C. Swain, architect, 12, Exchange-street, Manchester.

FEBRUARY 25.—**Sheffield.**—ALTERATIONS.—For alterations, including new bookcases and fittings at the Upperthorpe Branch Library, for the T.C. Mr. F. E. P. Edwards, City Architect, Town Hall, Sheffield.

FEBRUARY 25.—**Sheffield.**—PAINTING.—For external and internal painting at the Tramways Depot, Shoreham-street, for the T.C. Mr. F. E. P. Edwards, City Architect, Town Hall, Sheffield.

FEBRUARY 25.—**Shiney-row.**—HOUSES.—Erection of 18 houses at Shiney-row, and 39 at Fence Houses, for the Lambton & Hetton Collieries Co. Architect's Office, Philadelphia Lime Depot.

FEBRUARY 25.—**Various Towns.**—PAINTING, &C.—For cleaning and repainting bridges, station buildings, &c., at the following places:—(6) Woofferton, Tenbury, &c.; (7) Kington, Dolyhir, &c.; (8) Much Wenlock, Presthope, &c., for the Great Western Railway Co. Engineer, Shrewsbury Station.

FEBRUARY 25.—**Worthing.**—SHELTERS.—Erection of four glazed shelters on the Marine-parade, Worthing, for the B.C. Borough Surveyor, Municipal Offices, Worthing. Deposit £1 1s.

FEBRUARY 26.—**Aylesbury.**—PUMPING STATION.—For construction of pumping station and sewage tank in reinforced concrete, for the T.C. Mr. Wm. Harold Taylor, Borough Engineer, Town Hall, Aylesbury.

PROPOSED NEW BUILDINGS & OTHER WORKS.*

IN these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building owners taking the responsibility of commencing work before plans are finally approved by the local authorities, "proposed" works at the time of publication have been actually commenced. Abbreviations:—T.C. for Town Council; U.D.C. for Urban District Council; R.D.C for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; L.C.C. for London County Council; B.C. for Borough Council; and P.C. for Parish Council.

ABERDEEN.—Plans passed by the T.C.: Two semi-detached houses, Hammerfield-avenue, for Mr. Samuel B. Russell, bricklayer, per Messrs. J. & J. Cameron, architects; bungalow, Queen's-road, for Mr. Harry Chapman, contractor, per Messrs. Walker & Duncan, architects; house, Desswood-place, for Mr. John Reid, carpenter, per Messrs. Walker & Duncan, architects; four shops and store, Holburn-street, for Mr. Andrew Bowman, carver and gilder, per Mr. George Watt, architect.

ADWICK.—The U.D.C. has decided to apply to the M.H. for sanction to a loan of £4,867 for the purpose of a water supply on the new building estate between Doncaster-lane and the Great North-road at Woodlands; and a further £1,000 for surface-water drainage.

ASHBURTON.—Two houses, by Mr. F. Eales.—The U.D.C. proposes to erect 12 houses.

AYR.—The T.C. has agreed to construct a new sea-wall and esplanade at Blackburn bents in extension of the present esplanade. The probable cost is stated to be £12,000.

BARNSLEY.—Plans passed by T.C.: J. Smith & Co., Ltd., hotel, Huddersfield-road; A. R. Potter, conversion of house into two, Sheffield-road; T. Graham, house, Westbourne-grove; G. Ellison, two houses, Harbro' Hills-road; Capt. B. C. V. Wentworth, rebuilding of house, Needlewood; W. H. A. E. Gibbs, two houses, Carlton-road; J. Robert and A. Henshaw, two houses, Wentworth-street; Mrs. J. Vornberger, bungalow, Smithies-lane; A. R. Potter, plumber's shop and workshop, Beech-street; E. Audin, house, Woodstock-road; Miss Ibbotson, house, Woodstock-road; A. Turner, extension to model lodging house, Doncaster-road; Barnsley British Co-operative Society, Ltd., new business premises.

BEDFORD.—Plans passed by T.C.: Mr. E. H. C. Inskip, for Mr. R. Jeakings, house and shop, Hurst-grove; Mr. C. A. White, two houses, Bradgate-road; Messrs. Usher & Anthony, for Mr. W. Goldsmith, two houses, London-road; Mr. E. H. C. Inskip, for Messrs. Warton & Goodship, two villas, Goldington-road; Mr. E. H. C. Inskip, for Mr. J. Foster, conversion to two flats, 4, Park-avenue; Mr. J. Sear, two houses, Kathie-road; Mr. E. Brightman, house, Cutcliffe-place; Messrs. Usher & Anthony, for Miss C. A. Veasey, additions, 31, Albany-road; Mr. A. W. G. Prosser, house, Pemberley-crescent.

BEDWELLTY.—The U.D.C. has asked the Powell Duffryn Coal Co. and the Gellygaer U.D.C. to join in the construction of a bridge at Tiryberth.—The Council has passed plans for proposed extension of the Council offices at Aberbargoed, at an estimated cost of £1,000, and will expend £500 on recreation ground improvements.

BLACKPOOL.—Plans passed by Buildings Committee: C. Auty, 2 houses, Grasmere-road; F. Unsworth, 4 houses, Rosebery-avenue; R. Fielding, 2 houses, Links-road; Senior & Barron, 2 bungalows, Bispham-road; J. Harrop, house, Watson's-lane; Holt & Dawson, 2 houses, Poulton-road; John Midgley, house, Broadway; J. Taylor, 2 houses, Condor-grove; J. Williams, 4 houses, Condor-grove; Vicar and Wardens of Holy Trinity Parish Church, parsonage, Central-drive; Cross & Whittaker, 2 houses, Condor-grove; A. Eden, 2 houses, Bispham-road; Pilling, France & Co., 3 houses, Warbreck-drive and Bedford-avenue; W. B. Snape, 3 houses, Warbreck-drive and Bedford-avenue; Mr. Demmallett, 2 houses, Piccadilly; R. Murdoch, 12 houses, Rothsay-road, and 6 houses, Keswick-road; Threlfall, Whiteside & Midgley, 2 houses, Holmcliffe-road; R. Dawson, 2 houses, Condor-grove; L. G. Wilkinson, house, Park avenue; Mrs. Walker, 2 houses, Holmcliffe-road; J. Fos[illegible] 2 houses, Boscombe-road; J. Parkinson & Sons, ho[illegible] Leicester-road and Leeds-road; Foster & Dickinson, 5 houses, Queen Victoria-road, Bela-grove, &c.; J. Gregson, 12 houses, Laurel-avenue; W. Spen[illegible] bungalow, Fleetwood road; Park Estates Syndicate, 5 houses, off Gorse-road; Osborne Mansions Co., L[illegible] flats, Osborne road; H. G. Mason, 6 houses, Worsley-avenue; J. Harrison, 4 houses, Whitegate drive; Glastonbury avenue; J. Rawcliffe, bungalow, Burgate; W. B. Denner, 5 houses, Watson's lane and Bain[illegible] avenue; R. Kirkham, 2 houses, Squire's Gate la[illegible] J. Fenton, bungalow, Romney-avenue (off [illegible] avenue); J. W. Clarkson, 24 houses, Orchard avenue; H. Johnson & Co., 6 houses, new street off Bispham-road; Mrs. Davies, 2 houses, Whitegate drive; J. Hargreaves, house and shop, Watson's lane; Mason, 14 houses, Grange road, Layton. The [illegible] poration have applied to the M.H. for permission to borrow the sums of £93,000 for the purchase of land for housing, &c., and £56,656 for street improvements.

BLYTH.—The T.C. have decided to erect 25 houses. 13 houses are to be built in George-street by the Cowpen Coal Co.

* See also our List of Contracts, Competitions, etc.

BOLTON.—The E.C. have received plans of a proposed extension at St. Joseph's, together with a report by the Committee's architect, which has been forwarded to the B.E.——The Borough Engineer submitted to the Streets Committee a plan showing a proposed improvement at the junction of Spar-road and Mayor-street, by rounding off the corner of the Spar-road Recreation Ground and setting back the entrance gates. The Committee approved the scheme and passed it on to the Parks Committee with a request that they will give up 99 sq. yds. of land forming part of the recreation ground.

BOSTON.—The Surveyor to the R.D.C. has been instructed to prepare plans for a new burial-ground.

BOURNEMOUTH.—Tenders are to be invited by the Borough Surveyor for the construction of two new bridges. One is to be situate at Alum Chine, and the other in the Boscombe Chine gardens. An early start is to be made with the erection of a new police station and court house, on the east side of the Law Buildings. Application for sanction to borrow £6,000 has been made for this purpose.

BROMLEY.—Plans passed by T.C.:—Bungalow, Burford-road, Mr. A. A. Webb; house, Park-avenue, Mr. A. Frampton; house, Highfield-road, Messrs. Woodhams & Tyler; house, Bromley Common, Mr. P. Coad; four houses, Warren-avenue, Mr. E. A. Stone; four houses, Alexandra-crescent, Mr. A. Frampton.—Plans passed by R.D.C.:—House at Hill View-road, Orpington, for Mr. C. E. Castellan; house in Hayes-lane, Hayes, for Mr. A. J. Bolton; bungalow at World's End-lane, Chelsfield, for Mr. T. G. Beavis.

BURNLEY.—The Improvements Committee of the T.C. have recommended that Colne-road should be widened 60 ft.; the estimated cost is £6,500. It is proposed to apply to the M.H. for sanction to borrow the money, and to the M.T. for a grant of 50 per cent. of the cost of the work.

BURY.—Funds are being raised by the Grammar School authorities for the purchase of the old Bury Cricket Field and the field adjoining it as an additional playing field for the schools.

CARLISLE.—The T.C. has received sanction to erect 200 concrete bungalows and 100 brick houses.

CASTLE DONINGTON.—Ten houses for Messrs. A. Ramsden and J. Bosworth.

CHEADLE.—The Surveyor to the Cheadle and Gatley U.D.C. stated it was their intention to carry out the whole of the proposed road widening works upon Brick-lane.

CHESTERFIELD.—The Board of Management of the Royal Hospital has instructed Mr. W. Cecil Jackson, architect, to prepare sketch plans and estimates of additional accommodation.

CHICHESTER.—The T.C. has decided to erect an additional 38 houses.

CHORLEY.—The B.E. have approved the site of a new Council School to be erected on the Highfield estate, and to be known as the Highfield Council School.——The M.H. has decided to approve the erection of 50 houses by the Chorley T.C. on the Highfield estate.——The County Roads and Bridges Committee have decided on a scheme for straightening the main Chorley-Bolton-road, at Skew Bridge Heath, Charnock, estimated to cost £18,000. A steel bridge would be erected, and a Government grant of 65 per cent. had been obtained.

COLNE.—The M.H. has sanctioned the borrowing of £4,997 for the purpose of the construction of a relief sewer and storm overflows in the Primet Bridge district. It was decided to make application for another £2,653 for the completion of the scheme.

CONISBORO'.—At the last meeting of the U.D.C., the Surveyor reported the sanction of the M.H. to the borrowing, with respect to privy conversions, of £1,660 for a period not exceeding thirty years; and £3,340 for a period not exceeding six years.——An application was received from the Conisboro' Housing Association, Ltd., for a subsidy and loan in respect to 500 houses proposed to be erected by them as a public utility society, off Garden-lane, Conisboro'. The Town planning Committee recommended that the M.H. be requested to authorise the grant of a subsidy of £100 with respect to each of the 500 houses.

COVENTRY.—It has been announced that Barr's Hill Secondary School is to be enlarged, and that further accommodation for boys' secondary school education is to be provided.

COWES.—To relieve unemployment and to increase the attractiveness of Cowes for visitors, the Cowes U.C. has adopted a £15,000 scheme for the erection of a sea wall and road in continuation of the present Western esplanade.

DEWSBURY.—Plans passed by T.C.: New ward at the Whitley Hospital.

DISLEY.—Structural alterations are proposed at "The Crescent" Hotel.——The R.D.C. have received a section of the M.H. to borrow £9,250 to construct a sewage scheme in a portion of their district adjoining Wilmslow. The scheme will be assisted by a Government grant, and work will commence next month.

DOUGLAS.—The Tynwald Court has voted £37,500 from the Isle of Man revenue to erect and equip a Secondary school at Douglas for 400 boys; £14,225 has been voted for alterations and additions to Park road School.

DOVER.—Plans passed by R.D.C.:—Bungalow, Capel, for Mr. H. J. Atkins; house, Kingsdown, for Mr. H. Briggs; bungalow, Temple Ewell, for Mr. F. Wigpott; bungalow, West Hougham, for Mr. H. R. Cook; house, Kingsdown, for Mrs. Chambers; house and shop, Lydden, for Mr. Copeland; bungalow, Capel, for Mr. A. W. Pope.

DRIFFIELD.—Plans have been approved of for a new road, submitted by Mr. Atkinson, architect for G. T. Wilson, Kendale, Driffield. The site is a line from Bridlington-road to the Bridlington-road, the roadway being 42 ft. wide, with a 6 ft. wide pathway along one side.

DROITWICH.—The Borough boundary has been extended, and a contract has been placed for the necessary extension of sewers at Falsham Pits.

DUMBARTON.—The T.C. has approved of plans by the Burgh Engineer for construction of a new road to connect Hartfield-gardens with the new municipal houses at Silverton.

DUNDEE.—Plans and sections of proposed new buildings have been lodged at the office of the City Engineer: Montague-street, Barnhill, cottage, for A. Sturrock.

EDINBURGH.—Linings granted by the Dean of Guild Court: Brown Bros. & Co., Ltd., reconstruct foundry at Rosebank Iron Works, Broughton-road; Mr. A. H. Obituary.

The death occurred recently, at Workington, of Mr. George Hy. Chambers, aged seventy, who had carried on business as a builder and contractor for over forty years.

Colchester Councillors' Subsidy.

The Colchester Town Council recently decided to send a deputation to the Ministry of Health with a view to the removal of the restrictions which prevent members of councils receiving a subsidy under the Housing Acts if they desire to build. A member of the Colchester Town Council, who proposes to build five bungalows, has been informed that it is illegal to take the grant of £100 per house offered by the council while he remains a member of the council. The Ministry of Health have upheld this decision. The Ministry, it is stated, hold that the receipt by a member of a council of a lump sum grant under the Housing Acts operates as a disqualification under section 12 of the Municipal Corporations Act of 1882.

TENDERS.

THE BUILDER

A JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR.

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

VOL. CXXVI.—No. 4230. FEBRUARY 29, 1924

ARCHITECTURAL DRAUGHTSMANSHIP.

ARCHITECTURAL drawing and the drawing of architecture may be two very different things. In architectural drawing we should, of course, expect to see the quality of architecture expressed in an architectural way with a certain reticence, conventionality, and insistence on whatever brings out the architectural values; at its best and highest it would also have a something of decorative quality, too; but the drawing of architecture might be taken to include architectural drawing proper and everything else whatever from Vilars de Honcourt to Prout.

The last hundred years, as we are reminded by the interesting little exhibition at the Architectural Association, in Bedford-square, has seen a steady and very interesting development in architectual drawing and never in the world before has there been so much or parallel to it in extent and quality.

There is the danger in all pleasures that we may mistake the shadow for the substance, and this has been probably in the mind of those who enveigle against pretty drawings and caution students against being led away by their attraction and so mistake drawing for architecture. We have also been warned against paper architects whose thoughts are concentrated on their drawing boards. Here, again, we have a useful counsel which may come to harm. We have yet to learn that there is any better method available for the design of a building than careful paper studies, and one must be a poor judge of architectural values if one cannot visualise a projected building from its paper studies. Models are of value, though often very misleading, and are only a fairly true guide when they can be viewed on a level with the actual line of vision from which the buildings will usually be seen. The fact is that if we were to eliminate draughtsmanship we should be hopelessly at sea, for the man who could visualise all that a building should be without paper aids does not in practice exist. That architectural draughtsmanship has a varied use goes without saying: even in its most mechanical and prosaic form it may have a quality of its own. We hope the habit is growing of making clear and readable drawings of a building, and its various parts with their accurate inter-relation explained, when useful, by careful sketches showing how features end or abut, if there be any cause for doubt. We are convinced that good expressive draughtsmanship for office use is a matter of great importance, though we fear many offices in the hurry and rush of business have got into rather careless ways about it.

One great mistake about draughtsmanship, a peculiar fault with most architects, is over-statement, and this especially applies to elevations which are practically always merely plans of the façades. Thus the roof delineation in elevations is in numberless cases a gross misstatement of fact, and so are many of the features of a building misleading in elevation. Therefore, the highly finished elevation in a competition is often misdirected labour. We have noted a growing tendency to over-elaboration of plans, which often rather confuses their understanding than otherwise. With the plastic or sculptural quality of a building, draughtsmanship seldom deals with any real approach to adequacy, yet there may be a quality of great value in a building itself from its texture and values of its plane surfaces. In the main the first value in the view of a building is to emphasise and explain its mass and its modelling with the significance of its main features. After that we desire some explanation of its details and texture. We may obviously over-accentuate one feature at the expense of others, or modify the horizontal or the vertical to an unfair degree if so desired. The serious student of architecture does not like tricks, but should he take it too seriously he may, on the other hand, reject all alleviations, owing to the dullness of his temperament.

Architectural draughtsmanship, at its best, is a beautiful art. At its best it calls for some critical understanding of the art of architecture, or else its true value cannot be expressed. Like other forms of illustration it is finest and most expressive when it is limited by a certain restraint of handling, when it avoids tricks and does not emulate the photographic lens. In some ways it is as fine an art as the art of architecture itself. When we speak of architecture we are not supposed to mean any sort of building, but only that which can claim to be styled architecture. Any sort of drawing may be called draughtsmanship and yet unworthy of notice. There is, however, a draughtsmanship which has so much of art in it that it may be contemplated with great pleasure and profit. Even those who can design well cannot always draw well, whilst some able draughtsmen are not specially gifted in the art of design.

Anyone who has studied the drawings made in the students' competitions in modern times may see at once if any sympathetic feeling for the subject has been displayed and whether the execution has been a mere task or a genuine pleasure. It seems impossible to expect that a drawing executed without pleasure to the draughtsman can give pleasure to others. Warnings have often been uttered as to the snare of "pretty" drawings, but the very word "pretty" would hardly occur to one as relevant to the character of a really good architectural drawing. There has been a vast quantity of vulgar, flashy, or characterless drawing produced in the last fifty years, but the great development of good architectural drawing during the past century or two is a noticeable and valuable product of modern times, which is, so far as we know, practically new in the world's history. We say architectural drawing and not the drawing of architecture, for the two things are often very different. The carefully and often beautifully-executed engravings of architectural subjects a hundred or more years ago were not architectural drawings in the sense we speak of now. Architectural drawings in modern times have generally been the work of accomplished architects or students of architecture and have ranged over every sort of medium, the most expressive probably being those executed in pencil, chalk, or pen-and-ink. A really worthy collection of such drawings would be a revelation to many who know of them only through their fitful reproductions in the Press. That they can appeal to the public in the same way as those executed by the pictorial artist with no special knowledge of, or training, in architecture, is not to be expected, for their emphasis is naturally concentrated primarily on the qualities of architecture which the public understand in only a small degree.

With some it may be a moot point how far architects should go in endeavouring to catch the eye of the public by clothing their design in the piquancy, breadth or sparkle of the artist's vision, and so secure an approbation which has little or nothing to do with the architectural qualities, but we may well believe that the architect who loves his art will not care very greatly for such fictitious joys. We have to remember that the public can, after all, appreciate some of the qualities of fine building. They like the dignity of big columns; they love the picturesque and they adore ornament. Who shall deny that such admiration has not its rightful place? The architect, if he be worthy the name, wants to find appreciation for those things which constitute the real beauty of fine building. He will not, therefore, readily give up his own sense of the vital quality necessary in that architectural draughtsmanship which is to do justice to his design; but he would be narrow-minded indeed, and perhaps even impolitic, if he rejected any of the aids which beautiful drawing may bring to the understanding and allurement of fine architectural design.

NOTES.

Architectural Designs. "This mysterious indefinable something, which we call architectural design," are the words used by Professor Beresford Pite, in speaking of the paper by Professor Percy Nobbs on "Canadian Architecture," and he expresses a doubt as to what Professor Nobbs was looking for in his description of Canadian work. The most impressive quality Professor Pite sees in these buildings is their scale, and he adds that "the sense of homogeneous style, a real feeling for ornament, and any expression of intellectual culture is almost sought for in vain." He contrasts the overwhelming amount of commercial architecture illustrated, which has no spiritual appeal, with the paucity of that which makes any appeal to the higher qualities of thought and life. He suggests that perhaps buildings of religion and education have not fallen much into the hands of Canadian architects. He reflects on the undoubted fact that the impressive buildings of the world in all ages have been devoted to other purposes than commerce or self-aggrandisement: "Until buildings of that character and motive arrive in the New World we shall still find the New World bursting the heavens with sky-scrapers for commercial development."

The City Churches. The arguments urged in favour of the destruction of the City churches indicate that the enthusiasts for demolition consider that the Church of England is moribund. Apparently, unless we sell the City churches and hand them over to destruction the dwellers in the suburbs cannot get the churches necessary for public worship. In other words, while the suburbs are prepared to support financially cinemas and public houses, they will only have churches on condition they do not have to pay for them! Religion demands sacrifice, and it would be better for the Church to resist rather than encourage any assistance out of capital.

The Pressure of Theories. Theories and principles are hard of wholesale application. *The Times* pertinently shows how Nash's broad, simple and refined treatment of Regent-street was brought into being with its quiet homeliness in a noisy, violent and brutal time: "If stucco be a sham how came stucco to be first favoured in an age whose cardinal merit was that it despised shams?" But may we not say that the sham stucco was quite a parallel to the courtliness and grace which overlaid the real brutality of its time? May not the world of to-day be getting the architecture it desires? This makeshift, apologetic age is surely not and could not be expressed in fine, rhythmical, and logical architecture.

Advisory Art Committees. The memorandum of the R.I.B.A. on Advisory Art Committees, which we print on p. 341, contains some useful suggestions, especially that in reference to the formation of an Advisory Art Committee in towns and rural districts. As we understand it, this is really a suggestion for a civic society in our towns, such as we have in Birmingham, and which has worked with such success—probably because it is in the hands of the right people, who try, in connection with leading citizens, to get things done. The suggestions contained in the R.I.B.A. memorandum are well worth careful consideration, and we hope steps are being taken to bring them before local architects and municipal bodies.

A Happy Issue. The announcement that two of the rejected County Hall lunettes have been acquired by the Underground Railway, and will be hung in Westminster Station, appears to us a very happy solution of a difficulty, and a far more suitable place. We have no ironical intention whatever in saying this, or in any way to deprecate what has been done, but it has averted the danger of a wholly inappropriate interpretation of mural art becoming established in our great buildings. The field of mural decoration which has as its background the contemplative and spiritual qualities in which the imagination delights to dwell, will, therefore, not become mixed up with an ephemeral application which, while wholly suitable in a railway station, should find no place in buildings less related to transitory things. We hope this beginning towards decorating our stations will continue, and that further opportunity will be forthcoming. By establishing itself in the right place, the many objections felt to the claims put forward to represent mural art in such ways will disappear, and the genus of the present experiments become better declared, their relation being much nearer to poster than mural art, both in spirit and treatment. It may also lead us to look in the direction where mural art may be found.

The Overhead Crossing. Sir Alfred Yarrow's offer to erect at his own expense a trial crossing in one of our busy cross-roads has already elicited a nervous objection that such a

From the Exhibition of Draughtsmanship at the Architectural Association.

Chartres Cathedral. From a Drawing by the late A. W. Pugin.

[A review of this Exhibition was given in our last issue.]

crossing might interfere with light or with the crowds that gather about the great shop windows. The objection as to obscuration of light is obviously ridiculous, and as to the shop window crowds, we are tired of the vested interests that cry out against every experimental reform. If such crossings are desirable to relieve traffic congestion, the shops would be well advised to make the best of it in a public-spirited manner and not to cry out before they are hurt. We do not believe that the shops would suffer at all, but we resent any suggestion that the public must go on suffering from traffic chaos in case by any chance an improvement might prejudice the sales returns of fashionable shops.

The Underground

The Underground is complaining that the public supports the "pirate" 'bus services while the traffic on the Underground shows a decrease. If it does not know why this is, we can tell it. It is because people do not like hanging like gibbons from straps in stuffy and overcrowded carriages. The Underground has even gone so far as to design almost seatless compartments, with poles and straps for the inmates to cling to. The "Tubes" labour under a further and unavoidable handicap: however well ventilated they may be, it is not the same thing as the outside air.

Art in a Public School.

Mr. Wells' book on "A Great Schoolmaster," though more propaganda of Mr. Wells' own theories than an actual work of reference, has revived interest in a great educationist. Those who wish to know the subject more intimately will turn to another book, "Saunderson of Oundle," edited by a committee of old Oundle boys, and giving us a store of unbiased information. Saunderson was essentially English, believing in the group spirit of work as distinct from individualistic self-expression, and his message has a wider significance than an educational method. It is interesting to notice that his pioneer of scientific modern education insisted more upon art values as an influence in education than did the majority of his so-called "humanistic" colleagues. Although hopelessly unmusical himself, he ardently encouraged musical talent, especially by making the boys sing in the music in the school services. In order to produce an unconscious taste and an interest in good work, he had the class-rooms hung with reproductions of great paintings, and also with photographs of architectural masterpieces. Considering the absence of such incentives from most of our public schools, and its reflection on public taste, Saunderson's innovation is the more remarkable.

Entrance Porch. Sir Edwin L. Lutyens, R.A., Architect.

Drawing by Mr. T. Raffles Davison.

The Recovery of Village Life.

In giving account of the resources available for the recovery of village life, which include the very useful Rural Industries Intelligence Bureau, the Village Clubs Association, and Women's Institutes, we convey only a limited idea of the resources growing towards this recovery if we forget the small workshops, which craftsmen are setting up, and which are increasing in number. In a variety of different occupations, such as pottery, hand-weaving, printing, woodwork, and other crafts, we have a nucleus round which much further activity should in time gather, and every encouragement should be given in the way of making them better known and directing local purchasers to them. In various counties these small workshops are establishing themselves, and as they develop give not only a measure of employment to others, but establish the practicability of finding a return from the locality for the good work they produce. The influence of educated and enlightened people, with a sense of the real needs of life and setting the example of contented labour, established in the country, should exercise on our villages an influence to direct them towards using their own hands to make and shape useful things with the freedom from the industrial tyranny of mass-production, and therefore likely to find delight in their work. There lies a better prospect for the restoration of beauty in these natural ways than in any others, and the young craftsman will do well to consider the advantage of establishing his work under these healthy country conditions, taking his part in this deeply important restoration.

Charing Cross Bridge.

In reference to the recent paper by Mr. Paul Waterhouse on Charing Cross Bridge, read at Burlington House, in which he summarised his remarks by saying, "C.C.B.M.G." (Charing Cross Bridge must go), we have pleasure in quoting, by the courtesy of the *Morning Post*, the following:—

Can Earth show anything in much worse taste?
Dull must the artist be who won't decry
A bridge so plainly a monstrosity.
This city should reclaim with all due haste
The beauty of its river so disgraced;
Up artists! architects! with each other vie!
Denounce it in the Press, and oh *do* try
Your very best to have the thing replaced!
Never did bridge more absolutely spoil
With its vile girders, river, banks, and view,
Ne'er did my soul before so much recoil
(The river goes on gliding, it is true!)
By Jove! the very columns make me boil,
And worst of all they've just been painted, too!

The author of this delightful comment, W. H. B., is Mr. W. Hodgson Burnet, Lic.R.I.B.A., of Windsor.

GENERAL NEWS.

"Luxury" Building.

In recent Parliamentary papers the Minister of Health states he is refusing sanction to the raising of a loan of £67,000 by the Hastings B.C. for the part cost of a new music pavilion on the ground that skilled building labour would be diverted from work of a more urgent nature. Mr. Wheatley also states, for a similar reason, he cannot see his way to pass a scheme for the building of additional public baths at Stoke Newington.

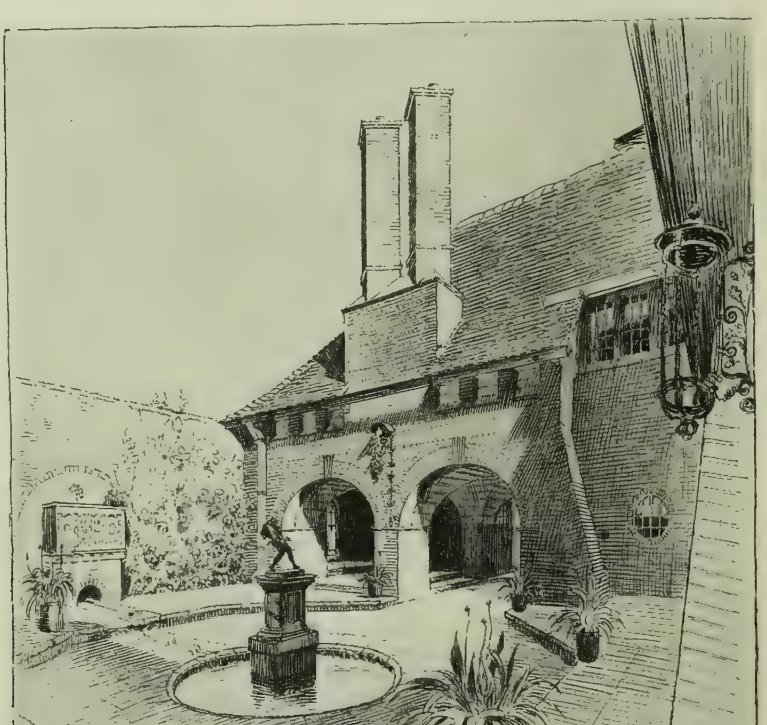
Soane Museum.

The trustees of Sir John Soane's Fund will meet at the Museum, 13, Lincoln's-inn Fields, on March 10, to distribute the dividends (which have accrued since January, from the sum of £5,000 2¾ per cent. Bank Annuities, invested by Sir John Soane) among distressed architects and widows, and children of deceased architects left in distressed circumstances. Forms of application may be had at the Museum, and must be filled up and delivered there on or before March 4, after which no application can be received.

Sydney Harbour Contract.

The New South Wales Cabinet has recently been considering the tenders for the construction of the bridge over Sydney Harbour. Their controlling engineer, Mr. Bradfield, has recommended the acceptance of the tender of Messrs. Dorman, Long & Co., at £4,500,000. The work is expected to occupy about ten years. Messrs. Dorman, Long have branches at Sydney and Melbourne.

Downham Estate.



The L.C.C. is to make a start with the development of the Bromley-road section of the "Downham" Housing Estate at Grove Park, the erection of 2,000 houses having been sanctioned by the Ministry of Health. The Council has been recommended by the Housing Committee to accept the tender of Messrs. Holland & Hannen & Cubitts, Ltd. Allowing for certain charges, it is estimated the deficiency will be equivalent to £17 per house per annum.

In recommending sanction for the borrowing, by the Woolwich B.C., of £30,240 for the building of 60 houses at Eltham, the Finance Committee of the L.C.C. estimates the net deficiency for twenty years at approximately £16 6s. per house per year.

Bishop of Coventry on Housing.

The Bishop of Coventry, with regard to the City Council's proposal to erect 1,500 houses, writes in his *Diocesan Magazine* as follows:—

"Without hesitation, I call upon the clergy and Church-people of the city to support the Council in the bold step which they have taken. It will not provide all the houses that are necessary, and plenty of room will be left for private enterprise, but the conditions of life for something like 10,000 people, counting those who will live in the new houses and those who will benefit by the relief of the pressure on the present accommodation, are at stake. Individually we can do little to solve this problem, but when an outstanding proposal of this description is made, we can put our weight behind it and push with all our power."

From the Exhibition of Draughtsmanship at the Architectural Association.

The Fountain Court, Deanery Gardens, Sonning.

SIR EDWIN L. LUTYENS, R.A., Architect. Drawing by MR. T. RAFFLES DAVISON.

St. Leonard's Church, Newton Abbot.

The new pulpit at St. Leonard's Church, Newton Abbot, Devon, was dedicated recently. The pulpit takes the place of the old wooden structure, and the design was prepared by Messrs. Rowell, Locke & Son, of Newton Abbot, and the figures of St. Leonard, King Clovis and Bishop Remigius, which adorn the front, were carved by Mr. Herbert Read of Exeter. The pulpit has been executed in Beer stone, a limestone of a white cloour, which has been used extensively for work in many of the principal ecclesiastical buildings in the West Country, including the Cathedral of Exeter, in which it has been used from the Norman period downwards. The stone is specially noted for its agreeable appearance and its fitness for delicate carving.

This stone has also been used for the whole of the interior of the Hall of Memory, Birmingham, of which Messrs. S. N. Cooke and W. N. Twist, FF.R.I.B.A., are the architects.

COMPETITION NEWS

Leicester Fire Station.

THE design of Mr. Trevor Sawday has been accepted in the Leicester Fire Station Competition, and Mr. Sawday has been awarded the first premium of £100 and appointed architect for the building. The second premium (£50) has been awarded to Mr. Arthur J. Wood, and the third (£25) to Messrs. Moore & Morley.

Hereford Market Hall and Gravesend Housing Competitions.

The R.I.B.A. Competitions Committee calls the attention of members to the fact that the conditions of these competitions are not in accordance with the regulations of the R.I.B.A.

Proposed Lay-out Competition, Valletta, Malta

The President of the Royal Institute of British Architects has nominated Mr. Edward P. Warren, F.S.A., F.R.I.B.A., and Professor Patrick Abercrombie, A.R.I.B.A., as joint assessors in this competition.

Proposed Constantine Technical College, Middlesbrough.

The President of the Royal Institute of British Architects has nominated Mr. Percy Thomas, O.B.E., F.R.I.B.A., as assessor in this competition.

Masonic Peace Memorial.

For full particulars of this competition see our issue for February 8. No sending-in date has yet been fixed.

The President of the Royal Institute of British Architects has nominated Sir Edwin L. Lutyens, R.A., F.R.I.B.A., as one of the three assessors in this competition.

New Law Courts, Cairo.

The assessors have awarded the first prize in this competition to MM. Erlanger, Azema, Edrei & Hardy. The second, third and fourth prize have been awarded respectively to MM. Marc Alexandre, Brandon, and Radoslagof.

Freemasons' Hall.

The three assessors chosen to adjudicate in th competition are Sir Edwin Lutyens, Mr. Walt Cave, and Mr. A. Burnett-Brown.

Other Competitions.

Other competitions still open include t following (the dates given are, first the sendin in date, and second the issue of *The Builder* which full particulars were given):—Essa on Heating and Ventilating (Mar. 3 Nov. 9, 1923). Industrial Designs (Jun Dec. 21, 1923). National Theatre (April 2 Monument to Sir Wilfrid Laurier (April Dec. 14, 1923). Belfast Union Lighting (Marc Nov. 9, 1923). Dunfermline War Memor (March 8; Dec. 28, 1923). Newcastle Conc Hall (March 1; Oct. 26, 1923). Ross-Smi Memorial (Sept. 30; Feb. 1). Newcastle F Station (March 27; Feb. 1).

THE NEW RENT BILL.

It seems that legislation dealing with the property in houses is to become an annual development, regardless of the fact that Rent Restriction is one of the principal causes of the shortage of houses. We have always consistently maintained that the introduction of Rent Restriction in the form that was adopted was a very serious mistake even in the war, and our view has been abundantly justified by subsequent events. The sanctity of private property was attacked and housing and rents were made the subject of a political gamble just at a time when the production of houses was one of the most important questions of the day, and ever since the private owner, or builder of houses, has been treated as half criminal, half profiteer, whilst the tenants of his houses have been indulging in profitable speculations in subletting or letting furnished his premises.

It has been demonstrated that in the long run if houses are to be provided at economical rents, and not at the cost of the community, they must be provided by private enterprise, but far from encouraging private enterprise everything possible has already been done by successive Parliaments to make the building or owning of houses impossible, and rents have been the shuttlecock of legislation.

Private enterprise is the root upon which housing alone can flourish and it should be cultivated with care, but the Rent Restriction policy has killed it and the renting of houses at all has been made impossible; thus the policy adopted, to carry on the above simile, has been like the horticulture of children who every week dig up the roots of plants, or the seed they have sown, in order to see how the plant is going on or the seed germinating.

We have not the text of the Bill now introduced by a private member before us, but, as he described it when contrasted with the Act of 1923 as "a tenants' Bill," little more need be said about it, for we have as yet not seen any measure that could be described as a "landlords' Bill." Some concessions have been made to landlords in regard to their own property, as a gracious favour, but all the Rent Restriction Acts have been "tenants' Bills," and the tenant is now reaping the fruit of them in the shortage of houses and in finding that the leasing of houses has been rendered impracticable.

From the statement of the mover of the Bill we gather that it proposes that Rent Restriction is to be continued until 1928, that all the grounds enabling a landlord to obtain possession are to be swept away, except when he requires his house for his own occupation, and even then that he must find alternative accommodation for the statutory tenant, that the 15 per cent. allowance of increased rent is to be cut down to 10 per cent., and the allowance for repairs from 25 per cent. to 15 per cent., and, lastly, that all the houses included in the Act of 1920 are to be put back under control. This being a private member's Bill, it would appear unnecessary to notice it at all were it not for the fact that the Government has expressed approval of it, though not accepting responsibility for it, and that the Minister of Health, who is responsible for housing, supported it in a speech in which he attacked private enterprise.

That speech as reported it is a little difficult to follow, for he attributed the killing of private enterprise in housing not to the causes to which it is usually attributed, but to the competitive system and "private enterprise in fixing wages." Having thus diagnosed the cause of death of private enterprise in housing, as well as in some other departments of industry, he proceeded to point out that although one way of providing houses was to build them for the people who could afford to buy them, that only provided for a limited section of the community, and the subject to which he desired to call attention was that as the economic condition of probably three-fourths of the community was such that they had to depend for housing accommodation on their ability to rent houses, it was the provision of houses for that portion of the community which was to be desired.

He then stated that the days of the private capitalists investing their money in houses to be let to the working classes had gone for ever, but when asked to give a definition of what he intended by the "working classes" in this connection he is reported as having defined them as "people who could not afford to own the houses they lived in." This definition would embrace a large number of persons whom the Labour Party usually decline to consider as belonging to the "working classes," but the important point to observe is that the Minister of Health in this speech made no suggestion how the position made by the decease of private enterprise was to be overcome except by restricting the rents of the remaining owners of private property and making them maintain the "working classes" until subsidised houses under the housing schemes could be provided for the housing of the population.

We regret that the Minister imported a great deal of class prejudice into his observations, but, leaving that out of the question, we should like seriously to ask on what principle were the owners of one particular kind of property asked to bear the burden of housing the population at a loss, at their private expense, until national measures can be devised to house that population? This is not Socialism, nor is it Labour, it is nothing else but a kind of commandeering of private property for the benefit of a section of the community. These owners, moreover, contribute to the subsidies as well as entertain the statutory tenants as half-paying guests in houses which the owners must not themselves enter; so they are hit both ways.

The present Government is not solely to blame for this extraordinary position, the long-continued policy of Rent Restriction has put an end to the well-tried system of landlord and tenant, and now houses cannot be rented and capital is necessary for the purchase of houses the whole community is feeling the effects of an ill-thought-out, and far too extended, artificial interference with one class of private property. Rent Restriction is in the nature of a narcotic, the more of it the patient is compelled to take the worse does he grow, but the doctors of the patient "Housing," instead of seeing how the doses can gradually be diminished, not only increase their frequency but also add to their strength.

It is, perhaps, hardly necessary to comment on the inconsistency of the Minister of Health's speech on this Bill. He is reported as saying that the competitive system which brought down wages as the productivity of the workers increased made it more and more difficult for the worker to pay the rent of the kind of house which the medical profession believed to be necessary to afford a decent standard of life. This assertion is not borne out by the statistics as to wages at the present time, but is out of date by about half a century at the very least, but leaving that out of the question, how does it bear on a Bill which proposes cutting down the permissive increases of rent to meet repairs from 25 to 15 per cent? Who does the Minister imagine will do those repairs? If the working classes are employed what wages will the house owner be able to give them with a diminished increase allowed for repairs and his rent reduced by 5 per cent. at the same time? It is quite clear that either the repairs must be scamped or they must be performed at an inadequate wage, and the worker will have to thank the Minister of Health for a reduction in his wages if that follows. We only mention this as an example of how ill-thought-out speeches on such measures can be. The Rent Acts contain provisions by which the local authorities can enforce repairs being done adequately, but the money has to be found by the house owner, and how can he perform his obligations if he is deprived of the necessary rent besides being allowed no choice as to his tenant?

One of the most unfortunate features of the policy of the Rent Acts has been that it has appealed to the imagination of those who desire to see the population well housed to such an extent that they only see one side of the question and fail to trace its economic results. The private house owner, so long as he exists, is in the position of any other industrialist, he can only pay what his property will bear; if his profits are restricted his activities and expenses must also be restricted, and at the moment he is even more handicapped than most traders, as he is called upon to give his share of the subsidies given to municipalities in connection with his own trade, the letting and production of houses, yet he receives no consideration from the Legislature. Perhaps one of the most extraordinary features of the debate was that the advocates of drastic Rent Restriction spoke as though they were making demands on national funds to tide over a crisis, and failed to appreciate that they were, in fact, calling for further sacrifices to be made by one class of owners of property.

There was common assent that the law required amending in one particular, exposed in the recent decision of Strickland *v.* Palmer (see this issue, p. 345), and that where rates are lowered the increase made in respect of rates should also be abated.

CORRESPONDENCE.

Unification and Registration.

Sir,—I notice in your columns correspondence on the subject of a circular which emanated from the Defence League, and was signed by Mr. Cross and Mr. Perks.

During the past few years the Royal Institute of British Architects has been troubled with two parties, both of whom seem to be pro-registrationists and who only differ on point of view of method. The annual elections have been fought, very often in a somewhat undignified manner, and both parties have had the opportunity of placing their views before the members of the Institute whilst in power, and on each occasion have suffered defeat.

I venture to think that there must be many other members of the Institute, in common with myself, who would greatly prefer that this constant turmoil were avoided, and that the Institute should be carried on as a staid and dignified corporate body of the qualified members of the profession, as it has been for many years past, and as it is now recognised by the general public. There can be no doubt that any attempt at unification or registration will only lead to a decrease in the value of the Institute Diploma, and in time the Institute would become very little better than a trade union. There are many far better ways in which the Council could use their energy and money for the betterment of architecture.

John Harold Kennard.

A Century of Architectural Draughtsmanship.

Sir,—In your review of this exhibition (now at the Architectural Association in Bedford-square), my drawing of Blickling Hall, by a typographical error, is described as having been made in "1869," at which period I was hardly out of my teens. It was not till 1883 that I was engaged upon the renovations and alterations which were carried out during two years for the late Lady Lothian. I then made other drawings of the mansion, this being the first of the series. Its date is on the title. The view was reproduced in Vol. I of the "New Series" of the R.I.B.A. "Transactions" in 1885, among a famous selection illustrating my paper on "Architectural Drawings," which I contributed at the request of the Council and read at Conduit-street on February 2 that year, when Ewan Christian was President.

Maurice B. Adams.

Chiswick.

Road Breaking Ramp.

Sir,—As a concrete and Portland cement expert of thirty years' experience I would like to protest publicly against the wanton waste of the ratepayers' money by the universal procedure of breaking up the solid concrete foundations of existing paved roads, causing thereby untold inconvenience to traffic and loss of money for materials and labour, and stoppage of business.

I continually observe steel wire netting reinforcement being laid down on the bare soil and about a foot of concrete poured over it. The wire is approximately ¼ in. diameter square mesh. How can it possibly benefit in any way the solidity of the concrete?—for to do so it should be laid between the mass and not underneath; and, further, repairs to water-pipes, gas-pipes, electric light wiring, &c., are constantly being carried out, and the wire cut away on every occasion and rendered useless in those parts. This steel wire must cost the ratepayers thousands of pounds and should at once be dispensed with.

The concrete bed, after the paving has been stripped off, will undoubtedly show slight sinkings or hollows. These can be roughed up and special chemically-treated cement grout floated over to former true level, and the road will be as good or better than new concrete, as all settlement has already taken place and all sinking stopped and the roads quickly opened up for traffic.

When one considers the wages and materials bill now spent by this mistaken reconstruction, I think it is time that the suggestions I make should be given a fair trial, and I am certain it would meet with the strong approval of the police authorities, as it would bring down their increasing traffic troubles by at least 50 per cent., and the rates by about sixpence in the £, and be a blessing to shopkeepers in the areas affected. The same labour used by repairing as I advise, in proportion to the same number of men to take up and relay, would be equal to about six miles repaired to one mile taken up and relaid, and no better than the six miles, as the new work will again have settlements and dips.

The saving on Portland cement, sand, gravel, &c., would alone be prodigious and with its standing charges, haulage and supervision, again would reduce the bill by thousands of pounds, and be used for better purposes.

I shall be pleased to demonstrate my claims at any place and time if desired by the powers that be, and would simply ask for a fair but severe trial.

Lewisham. Arthur Kelway Bamber.

From a Sketch by Mr. T. Raffles Davison.

The Two Demands.

Sir,—With reference to Mr. Yerbury's enquiry in your issue of February 22 to define the suggested system of payment. Perhaps this can be done most easily by giving an example, taking the easiest case, namely, cottage building.

The contractor and the respective foremen should first agree a value for the brickwork, joiner work, plaster work, &c. Let us suppose that the brickwork labour is agreed to be of a value of £40, representing the average cost of carrying out the work on the present hourly basis, tradesmen's wage being 1s. 8d. per hour and the labourers' 1s. 3d. The workmen at once should draw a wage of 1s. 10d. and 1s. 4½d. per hour respectively, being an increase of 10 per cent. As soon as the work is completed, if it is found that the cost has only been, say, £33, let half the savings, in this case £3 10s., be distributed amongst the workmen in proportion to their wages already received for the work. In arriving at this figure of £33, the writer considers that what at present costs £40 could, if a bonus on output system were introduced, without serious effort, be done on the average in three-quarters of the time at present occupied, which at the same rate of pay would amount to £30 0 0

Add the extra 10 per cent. already paid	3	0	0
Add the further bonus on output, being half of the difference between £33 and £40	3	10	0
Total	£36	10	0

Thus approximately increasing the earnings of the operative by 20 per cent. and reducing the cost of the work by 10 per cent.

It may be asked what is there to prevent the employer from squeezing down the agreed sum, in this case £40, to an unreasonably low figure. The answer is that unless the operatives had confidence that the figure decided upon would leave them a bonus, they would not take the real interest in the work which is necessary, and the result would be that the work would cost the usual £40 plus the 10 per cent. extra which the operatives received during the progress of the work, making the total cost £44, being 10 per cent. higher instead of 10 per cent. lower, due to the employer having suggested an unreasonable figure.

The writer considers that: (*a*) A bonus on work actually done is better than any profit-sharing scheme, as each small gang receives the benefit of its own industry and skill. (*b*) The payment is made promptly, whereas the benefit of any profit-sharing scheme would not reach the operative for a considerable time, thus robbing the scheme of all interest.

A Building Contractor.

Academic Dress.

Sir,—Academic dress for architects. Why not? The nickname of the college cap, "mortar board," and the gown, a relic of the ancient smock frock, proves its antiquity. Then the matter of prestige. What an impression on the workmen as the gowned and hooded architect came on the job and especially as he went up the ladder. Then, again, the client. How different talking to a man in robes to one in a tweed suit or even cloth. The question of fees would be settled by the very dignity of the academic dress.

To come to the practical. For hard wear, bricks and mortar, dust, &c., a good corduroy is reliable, but its stiffness is hardly suited for gowns. Let the gaiters, cut to archdeacon pattern, be of this, but for the gown a good buff-coloured flannel, such as used for navvies' trench slops, is excellent. The stole could be of striped towelling, useful in washing hands after going the round. In lieu of the old-fashioned square board cap (not adapted for modern buildings), a conical hat of stout ruberoid would be a safeguard against falling bricks, and would look impressive when hung up in the office. "Dignity & Utility."

[Other Letters.]

Letters on apprenticeship in the building industry and estimating are given on p. 353. —Ed.

TOWERS AND SPIRES.

By SIDNEY TOY, F.S.A., A.R.I.B.A.

VII.—THE OLD CATHEDRAL, SALAMANCA.

In the Spanish kingdoms of Castile and Leon the development of Romanesque architecture followed a course peculiarly national which had its most distinctive and happy expression in the cimborio or lantern over the crossing. The early principles of design appear to have been taken from Aquitaine and Lombardy, but, having regard to the open and spacious treatment of the crossing and the general rudiments of the design of this part of the church, the inspiration was chiefly from Lombardy. At San Jaime de Frontmyá, for example, the lantern over the crossing is almost a replica, except for the additional stage, of that at S. Teodoro Pavia, described in the last article (*vide* Fig. 15). But the principles having once taken root the builders developed the work on their own particular lines and evolved a central tower, which is among the most successful productions of Romanesque Art.

Probably the finest example of the Spanish school of this period is the Torre del Gallo over the crossing of the old Cathedral at Salamanca (Fig. 18.) The old cathedral appears to have been built during the latter part of the twelfth century, and the tower itself in the last years of the twelfth or early in the thirteenth century. In the sixteenth century a new cathedral, of comparatively vast proportions, was built on the north of the older church, and at this time the north wall of the latter was taken down and the north arch of the crossing rebuilt. But the tower above the crossing remains substantially intact since its first erection, and, thanks to its bold and firm construction, is still structurally sound. The work here is of stone masonry throughout. Departing from the usual custom observed in Lombardy the circular lantern is supported on pendentives and not on squinch arches, and it is here and in similar details that the influence of Aquitaine, where stone was also largely used, is observable.

The construction throughout is generally substantial, and to this factor alone no doubt the stability and good condition of the fabric is largely due, but the various forces and pressures set up by the dome and the spire above are also well neutralised and balanced. The lantern rises two stages above the roof of the church and is closed internally by a dome. The dome, though not a groined vault, is divided into sixteen compartments by bold ribs, in a similar manner to that over the lantern at Chiaravalle (*vide* Fig. 15). These ribs spring from the capitals of shafts and die into a large foliated boss at the summit of the dome, the shafts themselves rising through both stages of the lantern from a string course immediately above the pendentives. Both stages are relieved by arcades of round arches with simple mouldings, the lower arcade being left plain while the upper is enriched by bold cusping. Long narrow windows are pierced on the cardinal faces, but even where there are no windows the continuity of the arcade is preserved in each case, and the effect of these two tiers of arcades, with their simple but bold mouldings and the well-lighted dome above, is most striking as seen from the crossing beneath.

A tower such as this, which has successfully withstood the destroying agencies of many centuries, will repay close examination as to its structure. The drum of the lantern is strengthened by four large round turrets, with conical finials, over the piers of the crossing, and in order that the cardinal faces should be similarly supported the central bay in each case is projected slightly forward and this part surmounted by a heavy gable. The inner dome is well encased in masonry from its base to its haunches, and this mass of material, reinforced by the heavy pinnacles and gables, is amply sufficient to neutralise the thrust of the dome. The outer dome or spire is also efficiently buttressed by the four gables which rise through about half its height and are incorporated in its material.

It is interesting here to observe this early instance of the construction of the roof of the lantern in two distinct shells, the one seen from the interior only and the other being the true roof exposed to the exterior, a principle of construction which was reintroduced and developed many centuries later by the Renaissance architects at Florence and Rome. In this case the outer shell is raised well above the dome and assumes the form of a spire with a pronounced entasis, a form well harmonising with the Romanesque work with which it was employed. As seen from without this tower is most successful in the grouping of its projections and the disposition of its ornament. The round turrets are more plain than the drum of the lantern itself and their openings have continuous mouldings. The windows of the lantern are embellished by shafts with carved capitals, and generally the richer ornament is reserved for the upper stage. Above the lantern the projections round the base of the spire are most effectively grouped with the pointed gables alternating with the conical pinnacles. The surface of the spire is decorated with a scale-like ornament, the scales of which point downwards and not upwards, as observed at St. Front and elsewhere in Aquitaine.

Fig. 19.—The Collegiate Church at Toro.

Another example of a cimborio of similar character and date, but much less elaborate and imposing than the Torre del Gallo, stands over the crossing of the Collegiate church at Toro, about forty miles to the north of Salamanca (Fig. 19.) Here the work is relatively plain both in character and ornament, but the relationship is unmistakable. The drum of the lantern is divided into sixteen panels with flat faces, four of which are covered by the circular turrets. The ornament is subdued and the windows are narrow and plain.

With the examination of the beautiful tower at Salamanca it is proposed to conclude the present series of articles, but it is hoped at a later date to pursue the subject through some of its later but no less instructive phases.

THE TOWN HALL, STOCKHOLM.

By GEORG BROCHNER.

Sweden boasts a past of singular grandeur and glory, and the old Swedish spirit is still to the fore, with its high aims, always generously responding when called upon. Were this not so the city of Stockholm would hardly have become possessed of its magnificent new Town Hall, in which its architect, Professor Ragnar Östberg, has built himself a unique monument.

It has been a big undertaking, and it has taken time, its construction being decided upon on March 27, 1911. Since then the work has been steadily progressing, reaching its consummation on Midsummer Day, 1923, the 400th anniversary of King Gustaf Vasa, the maker of the Sweden of to-day, entering its liberated capital, and it was opened by King Gustaf V. Much eulogy was then bestowed upon the building, the architect, and his many helpers, and surely it was all fully deserved, for there is beauty and boldness and imagination and dignity in the lines of the town hall, as it raises its massive form and lofty tower over the broad sheet of water on the border of which it has been raised.

The Terrace, Stockholm Town Hall.

It is not an easy matter to describe this imposing edifice. If one asks whether the style is Swedish an affirmative answer would have to be very conditional, for Professor Östberg has in a subtle manner blended north and south, the past and the present. There is much, especially in the view from the water with its columned façade, which will recall the south, but the simple dignity which marks the building as a whole, its very material, red brick, give it a stamp of the north. Its architect, quite spontaneously, has discarded many accepted ideas, and has in his conception of the whole plan evidenced much courage and much imagination. It is also Swedish in its great dimensions, and more especially in the embellishment of its festive halls. It is also truly Swedish in its many ingenious decorative details, and above the simple but impressive tower the gilded "lantern" and three gilded crowns—the heraldic emblem of Sweden—stand brilliantly out against the northern sky. This tower and to some extent the smaller corner towers, the spires of which bear a highly decorative gilded sun and moon, the vast expanses of red brick beneath the copper roof, and more perhaps than all the rest the colonnade against the water, are the more striking features of the exterior. But there are also decorative features of less degree, some modestly hardly attracting the attention of the visitor, others, or one at least, furnishing a quaint and highly ornamental effect, viz., the open-air canopied sarcophagus, rich in gold and blue, of Birger Jare, the founder of Stockholm, placed against the base of the great tower—a peculiar but picturesque arrangement when viewed on approaching the town hall from the city, which the great Earl faces.

Between the building and the water, down to which lead monumental steps, is a formal garden, and flagged walks traverse the lawns in geometrical fashion; there are a couple of fountains free from unnecessary and unwanted elaboration, as is also the balustrade against the water. The western end of this ornamental garden is slightly elevated, and here are three much discussed nude statues of a famous author, poet and painter, all departed in comparatively recent years.

The courtyard is spacious and impressive with its decorative flights of steps, its balconies, and the enchanting view of the many columns to the water beyond.

If the exterior impresses by its dignified simplicity, no less impressive is the interior, with its suite of large elaborately decorated halls. There, as in other portions of the building, mediæval and Renaissance blend with more modern motifs. The town hall has been a very costly building, but Stockholm is not only a beauty-loving but also a rich city. There is the gilded hall, with a wonderfully handsome patterned floor of green Swedish marble, and the Blue Hall, a study of harmonies in blue, with a blue, silver-fringed baldaquin high up under the roof, a smaller hall, the Hall of the Three Crowns, and so on. The furniture has been all specially designed, table and chairs elaborate and stately, beautiful woven tapestries, rich blue glass bowls for flowers, clocks and volumes, all Swedish. A number of eminent Swedish artists and craftsmen have for years been engaged upon work for the town hall, as one distinguished writer said, like their fellows of Venice in the days of her glory. The only exception are the Oriental rugs, unique in quality and measurements, selected by special experts, and the nine bells which were cast in Holland, and a smaller replica, made in Denmark, of the famous ancient clock in the cathedral of Lund, West Sweden. Otherwise "Stadshuset," as it is called in Sweden, is truly all Swedish.

The Blue Hall, Stockholm Town Hall.

Weybridge Cottage Hospital Competition.

Scheme No. 4 was submitted in this competition by Messrs. P. J. Westwood & Emberton, and not as stated in our last issue.

DINNER TO SIR J. J. BURNET.

Sir John James Burnet, A.R.A., R.S.A., LL.D., was entertained at a dinner in the Trades House, Glasgow, recently, to celebrate the honour conferred on him last year by the award of the Royal Gold Medal for Architecture.

In reply to the Chairman, Sir John said his election as R.I.B.A. Medallist came to him as a great surprise. He had never thought of his name being added to that long list of men who had in one way or another advanced the cause of architecture, never thought that he might find himself alongside of his Professor in Paris (Monsieur Pascal), or follow the late Sir Rowand Anderson, the first "provincial architect" to receive the honour. That his work had seemed to his colleagues throughout the country worthy of such an honour was, he felt, a great reward, and that his colleagues in Scotland, who had known him almost from the beginning of his career, should have taken that way of showing their approval of his election, was a joy for which he felt he could not adequately thank them.

Sir Hugh Reid, Bart., in proposing the toast of "The Royal Institute of British Architects," said the Institute stood for all that was best in British architecture, ensuring as it did that utility and strength, and wherever possible beauty, would be found in the work for which its members were responsible. There were always problems in architecture to be solved, but of all the subjects engaging attention at the present time the housing problem was perhaps that which was exciting most interest. The best architectural knowledge and skill might help in the solution of such questions as to whether garden cities were the best or the only solution, or whether the provision of residential flats, now so much in demand, in larger and higher buildings well back from the main thoroughfares, and in open spaces, would not be equally satisfactory or even more satisfactory. While everyone would admit that in the country the garden city was the ideal solution, there were many who believed that larger and higher and isolated buildings, well placed on open sites, would be much more satisfactory in the large towns, as the buildings would not only be less costly in upkeep but would permit of provision for complete co-operative services, besides facilitating by concentration the important question of transit.

Mr. Ian MacAlister, who responded to the toast, expressed the regret of the President of the Royal Institute, Mr. John Alfred Gotch, that he was unable to be present to join in doing honour to Sir John Burnet. In the south, he said, they fully appreciated the services of Sir John Burnet to architecture and the wonderful efforts that were known by his name during the last 20 years.

Sir Robert Bruce then gave the toast of "The Sister Arts of Painting and Sculpture." He said there was no place in Scotland where the praises of these arts might be more appropriately sung than in Glasgow. He believed it to be a fact that within a radius of ten miles from that hall there were more treasures in painting and even sculpture than in any part of the British Empire outside London. If he were to say that painters and sculptors were upon a higher plane than architects he should provoke controversy, and he did not say it because he did not believe it was true. All were upon the same plane; each sought in different ways to reach the realm of the satisfying which was the beautiful.

Mr. G. Washington Browne, proposing "Our Friends and Patrons," remarked that much had been said and written lately about the paucity of the public who took any intelligent interest in modern architecture. But in this matter his sympathy was rather with the public. For had not modern architects much to blame themselves with for the alleged indifference of the public to them and their works. But with the emergence of the twentieth century one recognised a distinct disposition to shed exotics, and, influenced undoubtedly, whether consciously or unconsciously, by the new building material, ferro-concrete, to return to a more direct, simple, and, he should hope, national expression of their art in building. And in that return to a more direct and national expression of their art, he hoped they would succeed in recapturing the interest of their patrons the public. There was one direction in which they might assist in that recapture of the interest of their patrons He meant in the matter of exhibition of their works in the Royal Scottish Academy Exhibition. They had there a splendid gallery in which to exhibit their work, and he regarded it as a national misfortune and reproach that they should be annually under the necessity of making an appeal to England to sustain the interest of that gallery.

Mr. J. R. Richmond, in replying, said that as a community they in Glasgow were more alive to-day to the value of beauty and dignity in their surroundings than ever they were, and they were also beginning to realise that beauty and utility could be harmoniously wedded. As a layman it had struck him forcibly that architecture had shown less disturbance in its style, less tendency to be revolutionary, than any of the other arts, including painting, music, literature, and sculpture. He rejoiced to see that they were keeping away from some of those restless and bizarre examples to which Mr. Washington Browne had referred, and were returning to the solid foundation of the classic tradition.

ILLUSTRATIONS.

Raffles College, Singapore.

In this scheme, which was one of the two designs placed second in the recent competition, it was felt the main essentials to be considered were as follows :—

(1) That all school buildings should face north.

(2) That the buildings and roads should be planned to the configuration of the site to avoid cutting as much as possible, and to ensure the roads having easy gradients.

(3) That the buildings should be kept as high up on the site as possible owing to the liability of flooding.

(4) That the residential quarters for the European staff should be segregated and approached by means of a private road.

The lay-out is the result of these considerations. The residential school buildings are placed facing the playing-fields ; parallel to these on the opposite side of the main avenue are the administrative block containing the great hall and library, flanked on each side by the arts and engineering blocks, immediately behind which are their respective extensions, and in the rear the science block with its extension completes the group.

Generally the buildings are one-room deep with a verandah on the south side ; by this means a blow through the rooms is obtained and cross lighting. The sanitary blocks are isolated throughout, and the servants' quarters and kitchens to their respective school houses are cut off from the students' quarters.

The design is by Mr. E. Vincent Harris, F.R.I.B.A. The design placed first by Mr. Cyril Farey, A.R.I.B.A., was given in our issue for January 25.

Royal Masonic Boys' School.

The design by Messrs. Gotch & Saunders, P. & F.R.I.B.A., was submitted in the competition for a Junior School for Boys at Bushey for the Royal Masonic Institution. Messrs. Davis & Emanuel and Henry C. Smart's design, which was placed first, was given last week.

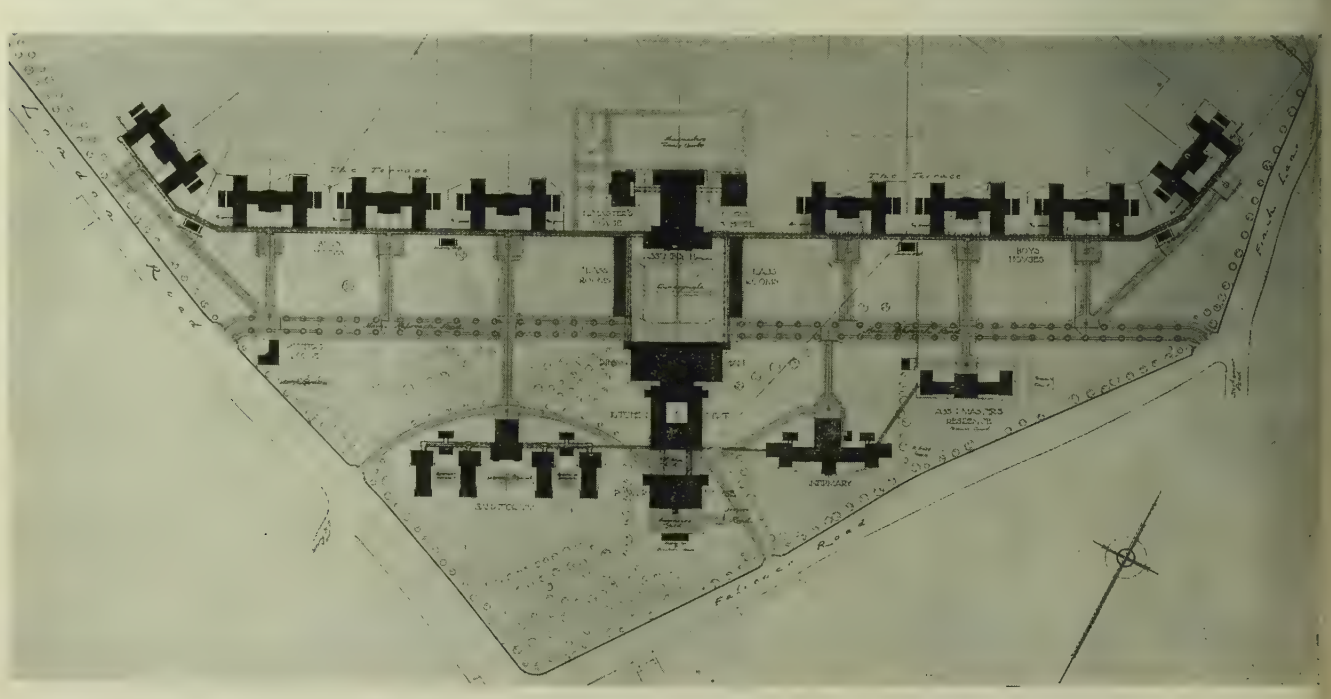
BIRMINGHAM ARCHITECTURAL ASSOCIATION.

THE annual dinner of the Birmingham Architectural Association was held at Birmingham recently. Mr. Rupert Savage (President) presided, and was supported by the Lord Mayor of Birmingham (Alderman T. O. Williams) and the President R.I.B.A. (Mr. J. Alfred Gotch, F.S.A.).

The toast of "The City of Birmingham" was proposed by Mr. William Haywood, who said that outside the city Birmingham was credited with much civic idealism and activity ; perhaps those who lived within the city were the least cognisant of its aspirations and its advantages.

"The Royal Institute of British Architects" was proposed by Mr. Rupert Savage, who said the Institute recognised that if architects were to receive the public support and appreciation which was desired they must fit themselves to justify their claim, and there were now established schools of architecture directly under the control and largely supported by the Institute. He hoped the presence of the schools would tend to correct the ignorance of architectural matters which existed amongst the public.

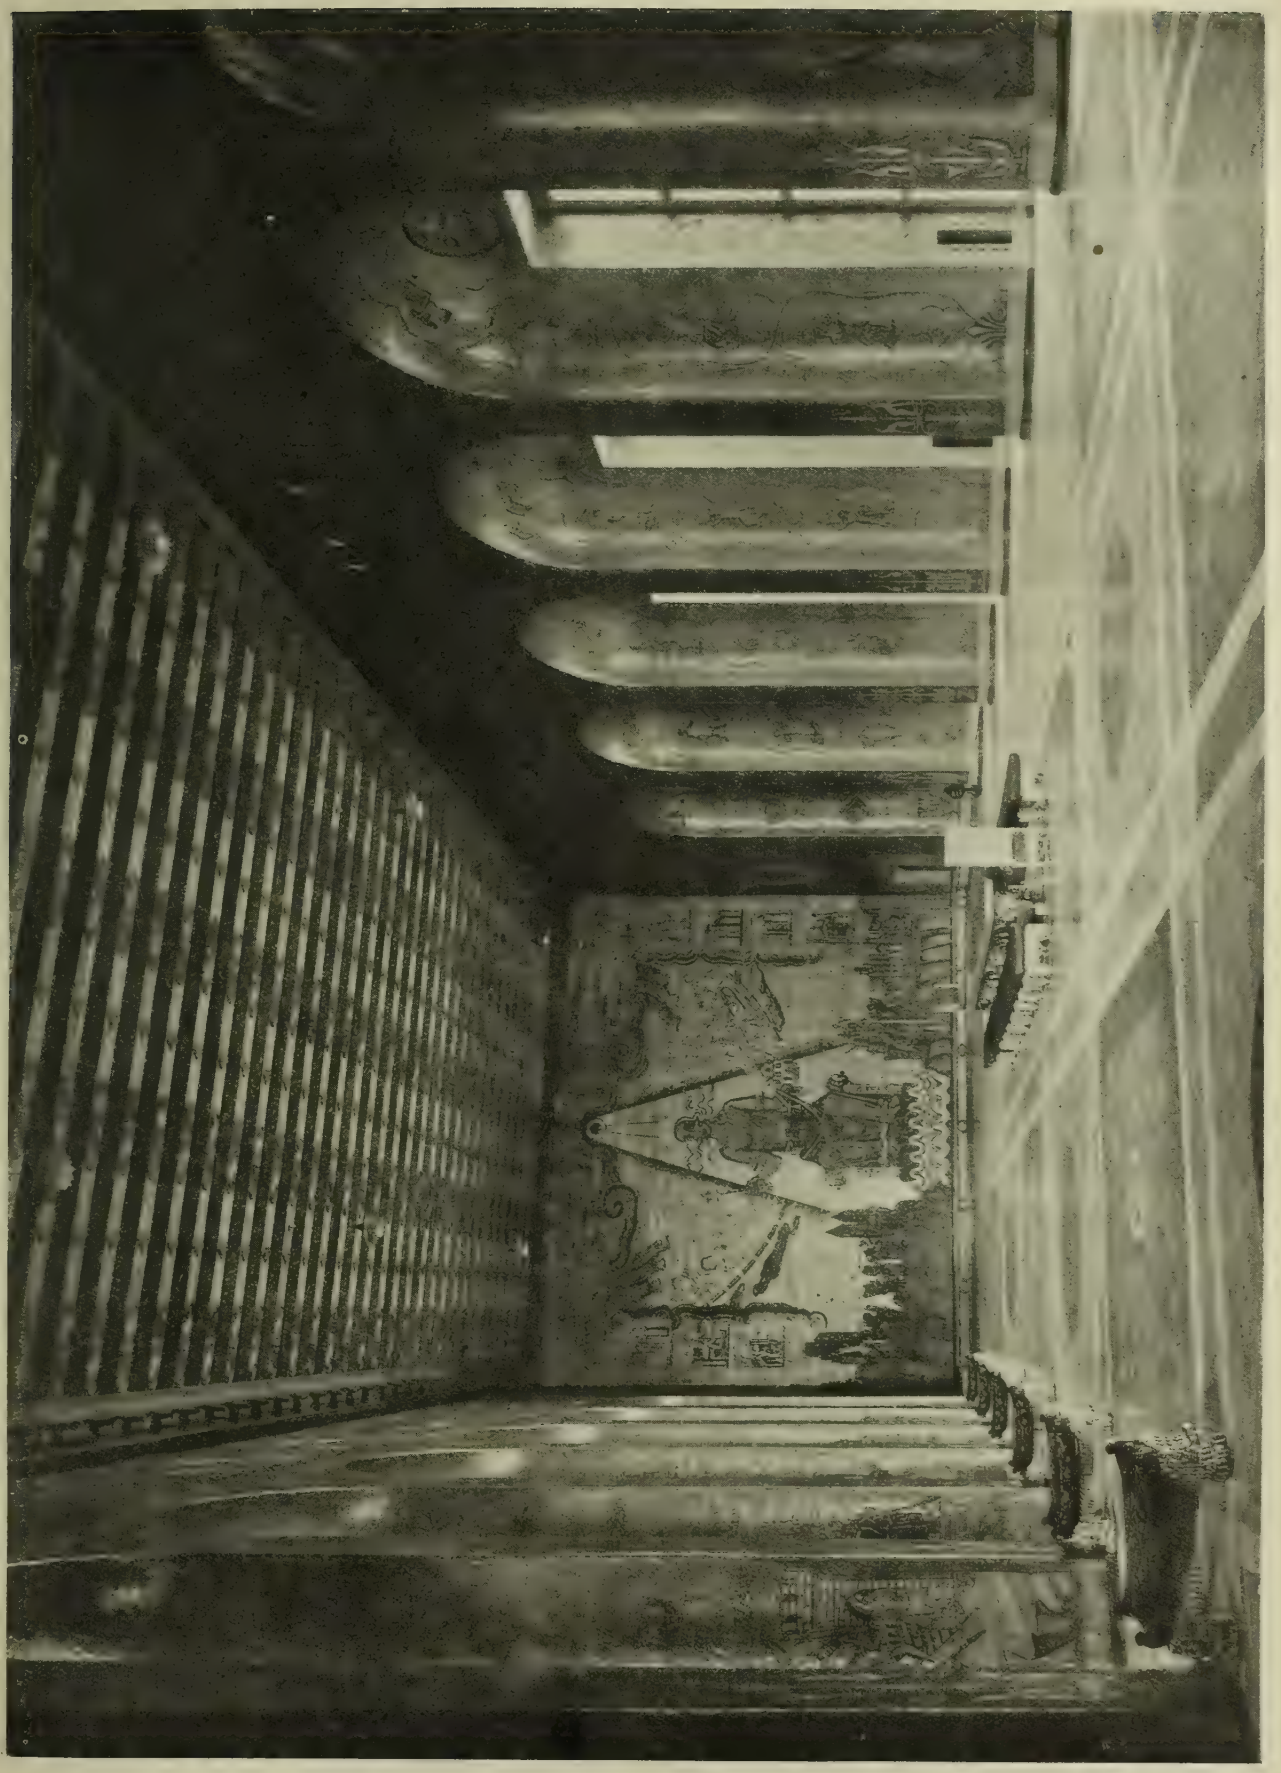
Mr. Gotch replied, and said it was with the greatest satisfaction that he observed the large part now being played by the allied societies—more particularly by the Committee of Presidents of Allied Societies. There was no doubt that as a result the policy and scope of the Institute's activities were being considerably broadened and a new spirit of enterprise apparent. The Institute had done much in the last few years to awaken interest in architecture and he felt that its efforts were now beginning to bear fruit. It had on many occasions been able to offer profitable advice to the Government and Public Authorities who, he thought, were beginning to realise that it was wise to relegate matters architectural to those qualified to deal with them. This was a great advance from conditions existing not so very long ago.



WHY ARE ARCHITECTS SELDOM ARTISTS ?

In opening a discussion on "Why are Architects Seldom Artists ?" at a recent meeting of the Birmingham Architectural Association, Mr. George Drysdale, F.R.I.B.A., said perhaps the easiest method of approach was to tabulate a list of reasons, as follows :—(1) Lack of understanding of human nature ; (2) lack of a sense of reality ; (3) the literary sense developed at the expense of the sensuous ; (4) lack of imagination ; (5) lack of the power of visualising things ; (6) lack of simplicity of thought ; (7) lack of sense of colour and of material ; (8) lack of nerve ; (9) lack of education and therefore of sound taste ; (10) lack of a sense of style ; (11) a conventional mind ; (12) the over-development of the commercial sense.

Mr. B. J. Fletcher, Principal of the Central School of Art, Birmingham, said a similar question might be asked of any group of artistic folk with equal pertinence, and with an obvious answer in each case. Why were so few painters or sculptors artists ? Of course, the answer was for the most part the same for all groups ; because nature did not produce artists as she produced gooseberries.



The extreme complication of modern buildings made it well-nigh impossible for an architect to unify and mould so many diverse and complex needs to a beautiful whole. It had been said that the finest things in many arts had been realised with the simplest technique and for the simplest needs, and some of the most impressive things in architecture bore that out. They seemed to be more and more driven to the position, freely taken by architects in America, of an association of experts. The calling-in of experts was no new thing in England, but it seemed desirable that their value should be more freely acknowledged and the creative atmosphere which came of free give-and-take among them exploited to the full. The separation of interests and departments could lead to no artistic unity ; new materials or fresh constructive methods were not combined or used expressively ; the strands remained separate. For that reason architects might be prevented from being artists.

One reason why architects were too seldom artistic was because of an ardent desire to be artistic first, rather than efficient builders first.

Design by MR. CHARLES T. BLOODWORTH (University of Liverpool)—Selected to compete in the Final Competition.

ROME SCHOLARSHIP IN ARCHITECTURE.

PRELIMINARY COMPETITION, 1924.

If the designs exhibited at the Royal Academy show certain qualities, they are undoubtedly more remarkable by their numerous mistakes. The standard of work submitted is disappointing, and obviously most of the competitors are quite unfitted to take full benefit of the opportunities the scholarship offers. None of the competitors seems to have any definite notion of design, expression and scale. One is surprised to see that no drawing has the right conception required by such a subject, nor the artistic emotion that a building erected to the memory of a great man should convey. Lack of imagination, lack of personal courage, and Emerson's "Nothing is more rare in any man than an act of his own" seems unfortunately true in this case. We have before us meaningless, colourless schemes of second-hand classic architecture, and Dame Architecture is a noble lady who resents being treated discourteously. "Art only begins where imitation ends," and "truth in art is the unity of a thing with itself; the outward rendered expressive of the inward." Nothing in these designs expresses the purpose of the building. Not one has the idealistic and true conception, for, after all, architecture is the conversion of an idea into a reality. Had the competitors read carefully the conditions, and digested them properly, certainly the solutions submitted would have been simpler and more appropriate. Had they asked themselves the question, "What is the difference between a lecture theatre, a military lecture theatre, and a memorial lecture theatre in a military college, perhaps they would have found what is missing in their designs, *i.e.*, the right interpretation. Most of the elevations are treated without character, and the architecture is quite insignificant. Some of them are reminiscent of old motifs treated by inexperienced hands. And what fitted the past does not always suit the present.

The set of drawings by No. 17 (Mr. Charles T. Bloodworth, see p. 340), show a lay-out which is not of a military character. The main approaches are somewhat muddled, and not wide enough, and the way from the parade grounds to the College is not large enough. The staircase leading to the galleries is hidden in a corner and seems to be added as an afterthought. The position of the reception room is not good. The elevation lacks expressive character. The crowning part of the centre of the front elevation is insufficient and its inscription would certainly never be seen. The section shows not sufficient sense of scale and the interior decoration misses the austerity which should be found here. The design has a marked resemblance to design No. 26.

Design No. 23 (Mr. Donald Brooke, see p. 339) presents a lay-out expressed with a military character which is in accordance with the programme. The plan is monumental, but not sufficiently studied, the stairs leading to the gallery dark and not properly placed. The halving of the museum of arms is a grave fault, and there is no direct access to the main building. The elevation is heavy and all the central superstructures useless, as clearly shown in section. The preliminary sketch is much better.

One might make the same reflections about the lay-out of the design No. 24 (Mr. Derek L. Bridgwater), which has nothing military, and the approach is encumbered. The plan is simple, but, entering by the main entrance, one is unable to find the staircase, which is hidden, and the shape of the lecture theatre is indefinite. The elevation has some military and even memorial character. It is one of the best elevations presented in the classic style, but one feels that the competitor has been unable to study properly the meaningless central motive which is a feature in the exterior, and does not express the section.

Design No. 25 (Mr. Francis X. Velardi) has a better lay-out in the preliminary sketch in which the shapes are definite and the quadrangle opposite the saluting point is more happily expressed than in the design produced after study. The plan is complicated, and had the elevation been treated with more severity, it would have had much character.

Drawing No. 26 (Mr. John H. L. Owen) presents a colourless lay-out. The plan has many qualities, but it is a pity that the rear portion has not been well studied. The elevation, simplified, would have had more character. The mouldings are badly designed, but the interior general character of the lecture theatre is pleasant.

Design No. 27 (Mr. Hubert S. Silcock) has the same faults as the others in the lay-out. As to the plan, its monotony might have given more results had it been studied more carefully. There is a memorial loggia, but no reserved space is to be found for an inscription or commemorative tablet. The section is simple, which is a quality, but lacks military character.

Design No. 28 (Mr. Marshall A. Sisson, see p. 345) presents a mediocre lay-out. The plan is simple, well-expressed, and severely treated, but it is a pity that the staircase is complicated, and the entrances to the vestibule badly arranged. The niches ought to be reversed in order to express the way in. The elevation has absolutely no character. One cannot define the purpose of the building, but the section shows that the author of the design is the only competitor who has a notion of human scale.

Design No. 29 (Mr. Herbert Thearle) has a lay-out well studied, but it does not exactly fit the programme. The acoustics of the lecture theatre are doubtful, unless infinite precautions are taken. There are three entrances to the building of equal importance, but they are treated in different ways. The elevation has a certain attractiveness, the Doric order being well treated; and it is to be regretted that the same character has not been observed throughout the elevation. The section is well treated, but the proportions should have been more studied.

The author of design No. 31 (Miss Elsie Rogers, see p. 343) has tried to find inspiration in Italian architecture, but has not been successful. The lay-out is complicated, and the plan unsatisfactory. There is no sense of proportion, neither is the importance of the relative value of volume understood. The two vestibules are almost as commanding as the main feature in the plan, viz., the lecture theatre. The access to the theatre is obviously on the wrong side of the room.

Among the designs which have not been selected, drawings No. 20 are interesting, and show the only competitor who realises the importance of inscriptions on a building of a certain type, and had the scheme been treated more austerely it would have been one of the best.

Considering the designs selected and the similarity of No. 30 to three or four of them, we wonder why it was not included.

The competitors do not seem to know that the expression of a building emanates from the purpose of the building, and its destination. All have tried the classic style, but why not study more the refinement of it, and its proper proportions instead of producing this sort of second-hand architecture. It is to be hoped that those who will go to the country of classicism will return with their store of architectural knowledge considerably increased. They need it.

Sculpture.

Certainly the most interesting of all these young artists are the sculptors. Their work is full of promise. No. 55 (Miss Pamela V. Harris) has most interesting pencil studies and her bas-relief has a wealth of character, and is simply treated. No. 53 (Miss Barbara Hepworth) presents a very decorative bas-relief, where the opposition of lines is very successful. The statue is well treated in a modern way, and the movement is well balanced. No. 56 (Mr. John R. V. Skeaping) shows serious studies, some of which need more finesse. He produces a beautiful statue which reminds one of the work of a famous sculptor. No. 54 (Mr. Frank P. Chambers) and No. 58 (Mr. Emile Jacot) produce decorative bas-reliefs most successfully treated.

ADVISORY ART COMMITTEES.

We have received from the R.I.B.A. the following memorandum:—

There has been, in recent years, encouraging signs of increased interest on the part of the general public in questions relating to the preservation and increase of the general artistic and natural amenities of towns and rural areas. Expression of this view is also shown in a desire to preserve the fine works of past ages, while the universal approval with which the recent appointment of the Fine Arts Commission has been received, and the formation of similar committees of taste which had preceded it in more than one provincial centre, clearly shows the increasing interest which is being taken in civic development generally and the desire for its treatment from the æsthetic as well as from the purely utilitarian standpoint.

The Royal Institute of British Architects is anxious to encourage these tendencies, and invites the co operation of those actively interested to secure that in the march of progress the claims of beauty are not forgotten. As a means to this end it suggests the formation of an Advisory Art Committee in towns and rural districts with the object of affording advice in a consultative capacity in all matters concerning the amenities of the district, including questions relating to the preservation of old buildings, the lay-out of new streets, open spaces, cemeteries, designs for proposed new public buildings, bridges, monuments or memorials, fountains, public means of lighting, fences, public conveniences, or other structures to be erected upon land belonging to or under the control of the local authority that may be referred to the committee, or as to which it may desire to give advice.

The constitution of the committee which is suggested will vary according to local circumstances, and will differ in urban and rural areas. In many towns, civic associations already exist, and the influence which those or similar organisations possess may suitably be employed to foster the establishment of an Advisory Art Committee. In smaller localities the machinery of the local Ratepayers' Association might be used. For example, there already exists in one London district such a committee of the Ratepayers' Association which is doing most useful work in safeguarding the amenities of its own district.

The findings of the Committee should be in the nature of recommendations only, and it may be necessary that all such matters as may be considered by it should be treated in strict confidence and not be divulged except by agreement with the local authority concerned.

It is essential that such a committee as is suggested should be representative of real artistic competence and judgment (though not necessarily of the purely professional kind), and that its members should be persons whose opinions are likely to command public respect. The cultivation and preservation of harmonious relations with the local authority is of the greatest importance, and the best means by which this end may be attained requires the most careful consideration.

The Royal Institute of British Architects, while not presuming to dictate upon the question of the constitution of Advisory Art Committees, will be glad to offer advice and such information on the subject as they possess, if required to do so.

THE MODERN MOVEMENT IN ARCHITECTURE.

Professor A. E. Richardson lectured at Manchester University on February 27 on this subject. Mr. A. A. G. Tulloch presided. In the course of his remarks Professor Richardson said that of recent years the theory of building has been subjected to closer scrutiny than at any other time. Many experiments and revivals had preceded the present stage; archæology had helped in the process; science had played its part; writers and critics had devoted their lives to a minute investigation of the principles underlying the concrete literature of the world. They now realised to some degree the value of all buildings worthy of the designation—architecture. The secrets of historical buildings were ready to hand, as were the designs most recently produced, which, in a few years, would in turn become famous. There could be no doubt regarding the advances made, especially in the field of theory and research. The architect of to-day, alive to the conditions of his own time, was asking: "Am I right in placing reliance entirely on my knowledge of the past?" Such an architect was confronted with the unprecedented development of costly buildings in America; he was aware of the scope of contemporary French architecture, especially planning; he viewed the struggles towards emancipation made by the Germans and the Dutch; and was spurred to further action by the activities of the people of Northern Europe. In this country, apart from the sphere of building, there were in progress a score of isolated movements; there were, for example, design and industry associations, town and regional developments, new schools of painting and applied art, new coteries of sculptors, as well as a group of scientists whose business it was to undertake the investigation of materials, old and new. Building, which a century since was the special province of the architect or the architect-engineer, was in these days regarded as a sort of Tom Tiddler's ground free to all and sundry.

To recount past history was a simple matter; even an analysis of old buildings with a description of their characteristics was comparatively easy. To define how the theory of building should advance was quite another line of country—it was almost impossible to forecast the future. The variety of buildings was so great, the expressions and emotions of the human race so diverse and complex, as to raise the question: "Was there any vitality of idea, any sequence and continuity within the works of builders produced during the past century throughout the world?"

To some extent there was, especially in Western Europe and America. The sequence, although slight, was in fact a legacy of the Renaissance. It had been maintained throughout the centuries after the dawn of the Renaissance, by the Greek spirit of perfection which all Europeans shared in common. If they carried investigation still further and began with Græco-Roman times, they would find that for over two thousand years building had enjoyed an intellectual status so far as the Occident was concerned. Building in its finer aspects during this cycle had responded to the emotions of peoples, to the autocracy of rulers, and the teachers of religion. The consistency had been due to a systematic study of planning, that was to say, from the structural nucleus of the plan had arisen definition, which, in turn, determined form, either Classic, Romanesque, Byzantine, Gothic, and later the works of the revival in Italy, and thence through Europe. There had, however, been many side-trackings and departures from the basic principles, because the tendency had been to subordinate use and function to decorative effect.

After the seventeenth century, the Renaissance in France, England, Spain, and other European countries, including Russia, more closely approximated in detail and ornament to the antique, and the theory of the structural nucleus became of secondary value to the passion for external splendour. The nineteenth century in every country brought into being a revivalist spirit, which endeavoured to employ known forms and historical motifs for especial buildings which, in so far as contemporary use was concerned, had no prototypes. Then ensued the struggle between fitness and polite expression, the latter a sort of rich mantle which enveloped the cramped structural lines. In most examples the structure was falsely conceived. Under this system the French developed planning, mainly as patterning on the grand scale, and in this were followed by their Continental neighbours.

It was now generally accepted that building was as much an affair of science as of art. In the abstract it was something that depended on logic and definite theories of scale, proportion and fitness, as well as strength of character and artistry to fit it for the concrete, when it left the crude stage and becomes architecture.

Investigation had proved that all building masterpieces, from the earliest times to the present day, followed certain uniform and fundamental laws of mass, horizontally and vertically. It was now possible, thanks to the labours of historians who took a delight in research, to follow the process of architectural evolution, and to estimate the several factors which had helped to bring about the development of stylistic expression. The curious thing was that the theory of structure had been partly, and in some quarters wholly, overlooked. It was obvious that the quest for external splendour and display had led to an unnatural regard for form, without sufficient inquiry into principles. They had studied effects, rather than causes.

All buildings had some characteristics in common, irrespective of size, of function, and of material. This was essentially the case in regard to their structure, and the components of structure. All buildings occupied certain definite spaces. In towns the structure was enclosed on two or more sides; and in the open the structure must have a silhouette.

They had met that night, continued the lecturer, to discuss building polity, in so far as the latter applied to the training of architects, the urgent need of interpreting present contingencies, as well as to gather ideas for future and improved development. It was their bounden duty to arrange the ground for the future, and to bring in to action views both retrospective and prospective.

First, let them consider the meaning of the term "modern." In so far as building was concerned it implied the latest expression of newness, and the gloss of novelty; it could be taken to mean recency of achievement and the present stage of advancement. In this sense, the modern could be said to represent the sum total of experience and known ideas. To bring about the present, in so far as the art of building was concerned, the intellectual scaffolding of the past had been used, not always with economy or due regard for prevalent conditions. The term "modern" in itself was ambiguous; did it refer to the past year or the past quarter of a century? Things changed day by day, and building in bulk, although vast in its scope, as one of the attributes of human expression, was in reality insignificant when considered in relation to the complexity of social conditions.

The past was a good servant but a bad master. It had its uses inasmuch as it offered explanations, but it was complete and could not be added to or altered.

Go where they would throughout the Kingdom, they were confronted with a vast assemblage of new buildings, some good, especially domestic works; some indifferent; and some beneath contempt. The majority of these buildings, especially in cities and towns, had been built without regard to cost; no economy had been exercised in the selection and placing of material. The buildings externally represented motifs culled from historical examples at home and abroad, the windows and doors lacked scale, and there was often a disregard for harmonic proportion between the components. The detail was a travesty and the ornament and sculptural interest despicable. Such works, even the best of them, were pale shadows, nay, caricatures, of the original models which might or might not have been used as exemplars. What was true of the external aspect was even more true of the internal arrangement. Far from being dominant and truthful, the structure—and by that was meant the plan—was often a confused juggling of the conditions, held together somewhat cunningly by steel props and obtrudent beams. It was this non-observance of principles, this adventitious display of archæology, that was causing thinkers to rebel against the rulings of coteries who would fetter the scientific art with illogical reasonings.

It was too often urged that architects were not practical, that they were prone to indulge in dreams and to follow fantastic motifs. This was a point that required explanation. To dub an architect practical was to class him with the plumber's mate. An architect, or chief builder, was a technician and a theorist, not a mechanic or manual worker. The term practical applied to an architect was nothing less than an insult. The man who was always proclaiming himself to the world as "above all things practical" generally had no other qualifications. He used the word practical as his stock phrase, and was in danger of immediate bankruptcy. The fact was that architects, builders, and artists were the people least prone to illusions; they had their limitations, and they made mistakes, but they were ever ready to acknowledge their shortcomings. Without advertising the fact, they were the most practical of men, for they aimed at the realisation of definite products.

The decadence of the art of building was bad, but the position was not hopeless, but until they reconstructed their theories regarding the wider issues of humanity and future conditions, it was useless to speak of a new style arising out of a readjustment of their preconceived notions of form. At the beginning of the eighteenth century, when taste in building on the big scale took on its definite bias towards the antique, there began the practice of collecting models, drawings, and data with which to increase the knowledge of classical form. There were fine essays in style and rare examples of scale and pattern planning, but no demonstration of a principle. It was the silver age of the Renaissance, when alloys were freely used in the hope of eking out the metal. The discourses of Sir Joshua Reynolds appeared reasonable enough to the young students of the Royal Academy when the master delivered them; their import was permanent enough to influence architects and artists through the last century. They counselled the observance of the known, and as far as the academic rulings of Composition were concerned were more than justified. But to apply these rulings and theories to the art of building, other than to the very narrow limits of obsolete classical form, was to obscure the finer vision of architects to the vital principles of building. The present revolutionary thought—it was not Bolshevik—aimed not so much at creating a new order of designing and fashioning, but a return to the structural principles of building, which alone could be used to express modern conditions. To the lecturer's way of thinking it was hopeless to be original by referring to past originality; it was an insult to one's intelligence to be told to go on copying form for form's sake. The good men copied old form well, and the bad ones copied it without inquiry. Hence the confusion. The searchlight of the present day had been turned upon the past most effectually. Everything was known; they could reconstruct old epochs, view the life of Egypt, Greece or Rome, live again amidst the idylls of the Renaissance, frisk as eighteenth-century Macaroni, American Colonists, French Revolutionists or Regency bucks, but such was our lust for the antique that they did not trouble to be natural.

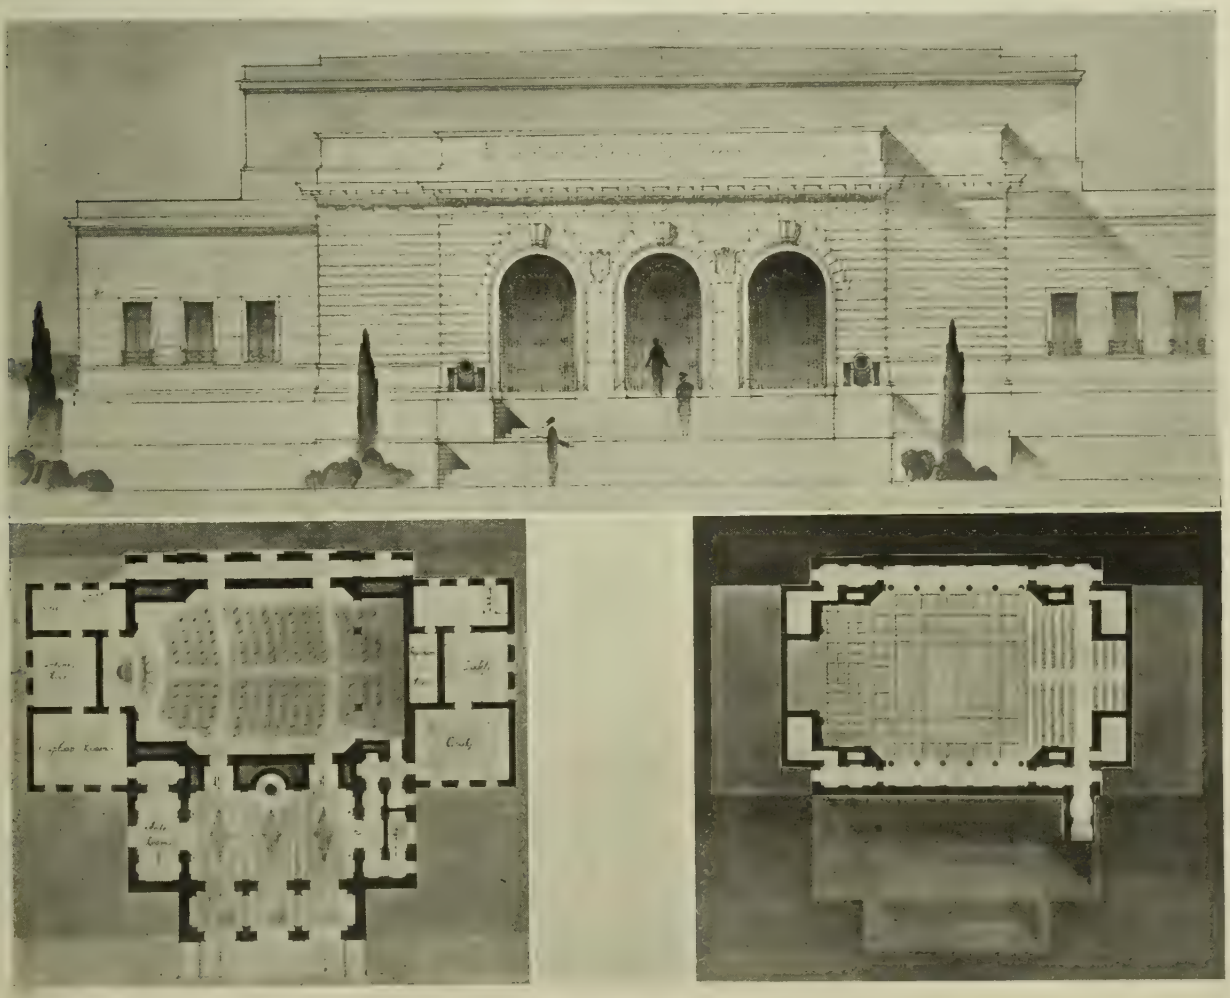
Continuing, Professor Richardson said lately he had been watching very closely the application of the structural theory in quarters other than those of architecture, and the honesty and directness of the result had convinced him of the necessity of changing his ideas regarding fitness of purpose and adequate expression.

The issue before them was: Were they to blunder into novelty of form and massing by flights of fancy, or were they to achieve style continuity, and thereby originality, by pursuing the analytical theory, in so far as archæology was concerned, endeavouring mainly to re-establish basic truths, rather than attempt to exploit specious forms?

Commonsense pointed to the re-establishment of basic principles—that was to say, a return to the primary theory that use and function determined structure, and that good structure would give originality of form. This was the only sane method to pursue if a style of building consistent with the early twentieth century was earnestly desired. It was logical, it was sane it was true. Professors and writers gloried in teaching that which they had acquired by pains and study. To minds accustomed to ascertainable facts, adventure was anathema. Thus it had come about that form and ascertained beauty and character had been given predominance over principles about which few inquiries had been made. If they applied their minds to the whole body of past architecture or building they found that certain definite laws existed regarding massing and grouping, both for main parts and minor parts, but in every case it was possible to attribute these results and effects to the primary cause of structure, which was both building and architecture, according to the specific purpose of the building so raised.

The subject of architecture was vast in its scope. It was impossible to define all the laws. In the main the scientific art was an abstract one, bound up, moreover, with the conditions of communal life. When they realised that the very complexity of present conditions demanded a return to simpler and more fundamental truths, they should be the more eager to throw off the trammels of convention. He hoped he had made it clear that study of the past, fine as it was, afforded no more evidence of what they desired for the present day, other than to show a few elementary principles developed through the centuries, with a certain logic and consistency. Future architecture would, it was true, be dependent on certain general laws and rulings, deduced from past achievement, but it would not brook literal transcription of historical models. All the previous teaching of writers and executants regarding tradition, qualities of materials, geometrical form, and association of components, as well as character and articulate expression, including combinations of colour and ornamental interest, which they regarded as decoration, would be referred to. But it was unreasonable not to expect that present-day views regarding domestic life, work, recreation and culture, as well as the preservation of natural and conventional amenities, would not play their part in aiding matters. There was one dominant principle, and to that he again referred. It was the philosophy of structure, bearing in mind such essentials as geometry and mathematics. The artistic intentions of the true builder would ever dominate the structural theory; the need of the moment was to check the craze for the discovery of a new old style, and to restore the scientific art to its once proud status, when the architectural forms arose from structural necessity, and were in sympathy with the conditions of the period that witnessed their production.

R.I.B.A. MINUTES.



We take the following notes from the Minutes of the Council Meeting held on February 18:—

Advisory Art Committees.—On the recommendation of the Art Standing Committee, it was decided to circulate to the allied societies an advisory memorandum on the formation of advsiory art committees for cities, towns and rural areas.

Wage Slips on Tenders.—On the recommendation of the Practice Standing Committee it was decided to inform the London Master Builders' Association that strong exception is taken to their action in issuing a notice stating that slips would in future be affixed to tenders providing for adjustments in the event of variations in wage rates, in view of the fact that the point is at present under discussion with the National Federation of Building Trades' Employers (which includes the London [Master Builders' Association).

International Cement Congress.—Mr. Max Clarke was appointed to represent the R.I.B.A. at the International Cement Congress.

The Royal Sanitary Institute Congress, 1924.—Mr. W. Glen Dobie, President of the Liverpool Architectural Society, was appointed to represent the R.I.B.A. at the Congress of the Royal Sanitary Institute.

Rome Scholarship in Architecture, 1924—Preliminary Competition.

COUNTY HALL PANELS AND MURAL ART.

BY REGINALD HALLWARD.

WE have both through personal acquaintance and general knowledge so much appreciation of the qualities of the young artists—or young students, whichever we decide to call them—that it is hardly fair that their efforts should be dragged into a somewhat unfortunate publicity owing to the sentimental and misguided zeal of those who directed them. It is unjust to the merit in the work of these young men not to carry the matter a little further. The rejection of these so-called mural paintings is primarily due to the fact that they were carried out under quite the wrong conditions, and the blame for the failure of the scheme is not to be charged upon the students themselves, or is there necessarily any reflection on the ability of the students in the rejection of their panels.

But this is not all. It will be recalled that on the occasion of the first exhibition held at the Royal Academy by the Arts and Crafts Society, the third large room was devoted to an exhibition of so-called mural art. As was pointed out in these columns, there was a complete lack of co-ordination between the panels, due to the absence of any agreed scheme which would have united them as a whole in their general treatment, and led to a result which was wholly fragmentary and opposed to the first principles of mural decoration, though some very able work was shown. The prospect for mural art, therefore, was much more likely to be hindered than furthered by such a display, and it appeared extraordinary that a movement to encourage wall painting should have been directed with such complete disregard of its requirements. All this is indisputable, and it seems almost incredible that the very same blunders should now have capsized the present County Hall scheme, in which the same neglect is seen to operate, no adequate preliminary scheme to co-ordinate the work having been considered beforehand, with the result that the different panels have been left to battle it out for themselves. The failure is to be regretted, (but it was none the less inevitable), and still more that the cause of mural art should have been promoted in such a way. It appears that there has been a tendency to usurp the position of representing mural art, and to forward it more through the methods of the publicity agents than in becoming ways. Mural decoration is better represented and its cause more truly furthered by artists working quietly in the right way, and without the kind of boosting that has accompanied the present movement, which, if intended to secure employment for young artists, should seek it in better ways.

The subject of mural painting is beset by so many obstinate heresies (coming chiefly from those without practical experience of the work) that a student may well be confused on the matter—which is really rather a simple one. Mural painting—that is, painting which is to occupy a particular wall space in a building—is governed by the conditions which the building sets up, and must be executed under those conditions—of lighting, distance from the eye, conditions of view, &c. To reach a result that can be satisfactory these primary conditions must be fulfilled, and they can obviously only be fulfilled when the painting is executed on the wall itself. Any alternative—the "studio" substitute of paintings done on canvas away from the site and afterwards stuck up—is a contradiction in terms of mural art. Anyone who has painted on the walls of an actual building knows that the influence of these conditions governs every touch. One writer, who has taken part in the correspondence on the subject, was enormously impressed by "the extremely inexpensive rate" of the cost of these panels. Surely this is putting the emphasis in the wrong place. Would not the Committee of the County Hall be more impressed with arguments which laid stress on the quality of the work itself? It is certainly curious to think that while this correspondent is so anxious that students should be encouraged to experiment on actual walls, he should not be more concerned with the methods through which they propose to do so. What is noticeable is the atmosphere of sentimentality and absence of practical sound judgment actuating the promoters, who, desiring to encourage mural art, neglected to apply sound principles to its approach.

But there is another aspect of the matter which concerns not a little artists themselves. It has been found very astonishing to some of them that it should have been thought necessary to depreciate the qualifications of older artists in order to make a case for the employment of students of the art schools on our public buildings. This challenge to experience and to the value of proved ability has been advanced by artists themselves. All sorts of suggestions and implications were made, such as "This particular talent is more likely among the young painters"—a comment of pure fustian to those who know the facts. I have no doubt that plenty of talent is to be found amongst the students, but why this desire by one set of artists to belittle the work of other artists? Surely a most regrettable feature, and a sign only of the want of any cohesion or proper loyalty between them such as would become the members of a great profession.

The cause of mural art has been much retarded in recent years by a great deal of very theoretic talk about it, laying down rules for its practice quite apart from those growing out of actual experience, rules which artists with better knowledge know to be very theoretic and away from the facts. It is not too much to say that there are no rules for mural decoration other than those which the equipment of any good artist includes, and the most important are the least communicable, as we do not make artists this way. Unfortunately the talker reaches the public much more easily than the doer, so that rather dry preconceptions detached from actual experience have secured a certain amount of attention with the public at the cost of the real interests of mural decoration. One dominating fallacy on the subject is that which would tie to a particular treatment, and invest mural painting with a mystery which does not belong to it. When we add to these theoretic views a practice which is satisfied with an approach leaving out of view the primary condition of mural painting, that it should be executed on the wall itself, we shall understand how desirable it is to test the truth of the matter against more real and riper experience, and the example of the past. I hope that young artists may find every opportunity to extend their practice, but it is not inaccurate to suppose that at the threshold of life there are not the resources of experience which enrich a nature for the adequate expression of the highest sort of art, for this epic form of painting, and it seems to me that the trouble lies in our estimate of the nature of art itself. Many of the exponents of this new mural art publicity propaganda are in closer touch with the art of the poster, so definitely improved in recent years. Let us retain the walls of our great public buildings plain until a conception of wall painting better than that, either of the Royal Exchange, for example, or the present effort directs us to find a treatment and approach more consistent with its needs.

But the situation is better than this if we look in the right direction, which brings me to a consideration most important of all. Are there no painters then of proved ability able to execute a mural decoration that we must depend on the students of the art schools? Such an idea will appear so ridiculous to anyone acquainted with the facts of the position that it is difficult to speak with becoming reticence on the matter. Is there no choice but that between "the stodgier and more nobly conscientious works by mature and eminent artists" and the experiments of the art schools—though the very form of the phrase is redolent of the cheapest journalese. There are quite a number of good artists I could name, some who have, and others who have not, before executed mural paintings—and, in spite of the experts, this really does not matter so very much—quite able to do significant and beautiful work in the way of mural painting, who have little or no opportunity of doing so, and who find that opportunity still further diminished by the intervention of popular and superficial interpretations which deprecate these sounder views on the matter. Above all let us be very slow to trust to any theories which separate into water-tight compartments, or make a mystery of one application of art over another, as though there was something sacrosanct, a rule of mural painting which needed its inspired devotees—some special preparatory approach and installation—on what is really a plain matter. Did these promoters of mural art understand the subject better, they would know that it is not on the practical, technical side that this is the case, and that the progress through painting to mural decoration is no more than the difference of form between lyric and epic in poetry—a form directed by the subject—much more a direction and inspiration of the mind than one for the text book, or for "botanising" over. We know there are among students themselves those who strongly support the view I am trying to express, and the idea that "crude forms" and gay colour are the only alternatives to "academic rhetoric," &c., begs the whole question. It does not lie between these, nor are the sneers at the work of older men at all becoming. Mural art will not be fostered in any such way, in that it does not lie in these extremes but in a spirit big enough to project through the mural form of painting themes which express the national life at its best and noblest. We shall be nearer to doing this when the mysteries invented by professionalism yield to a wider, more human point of view.

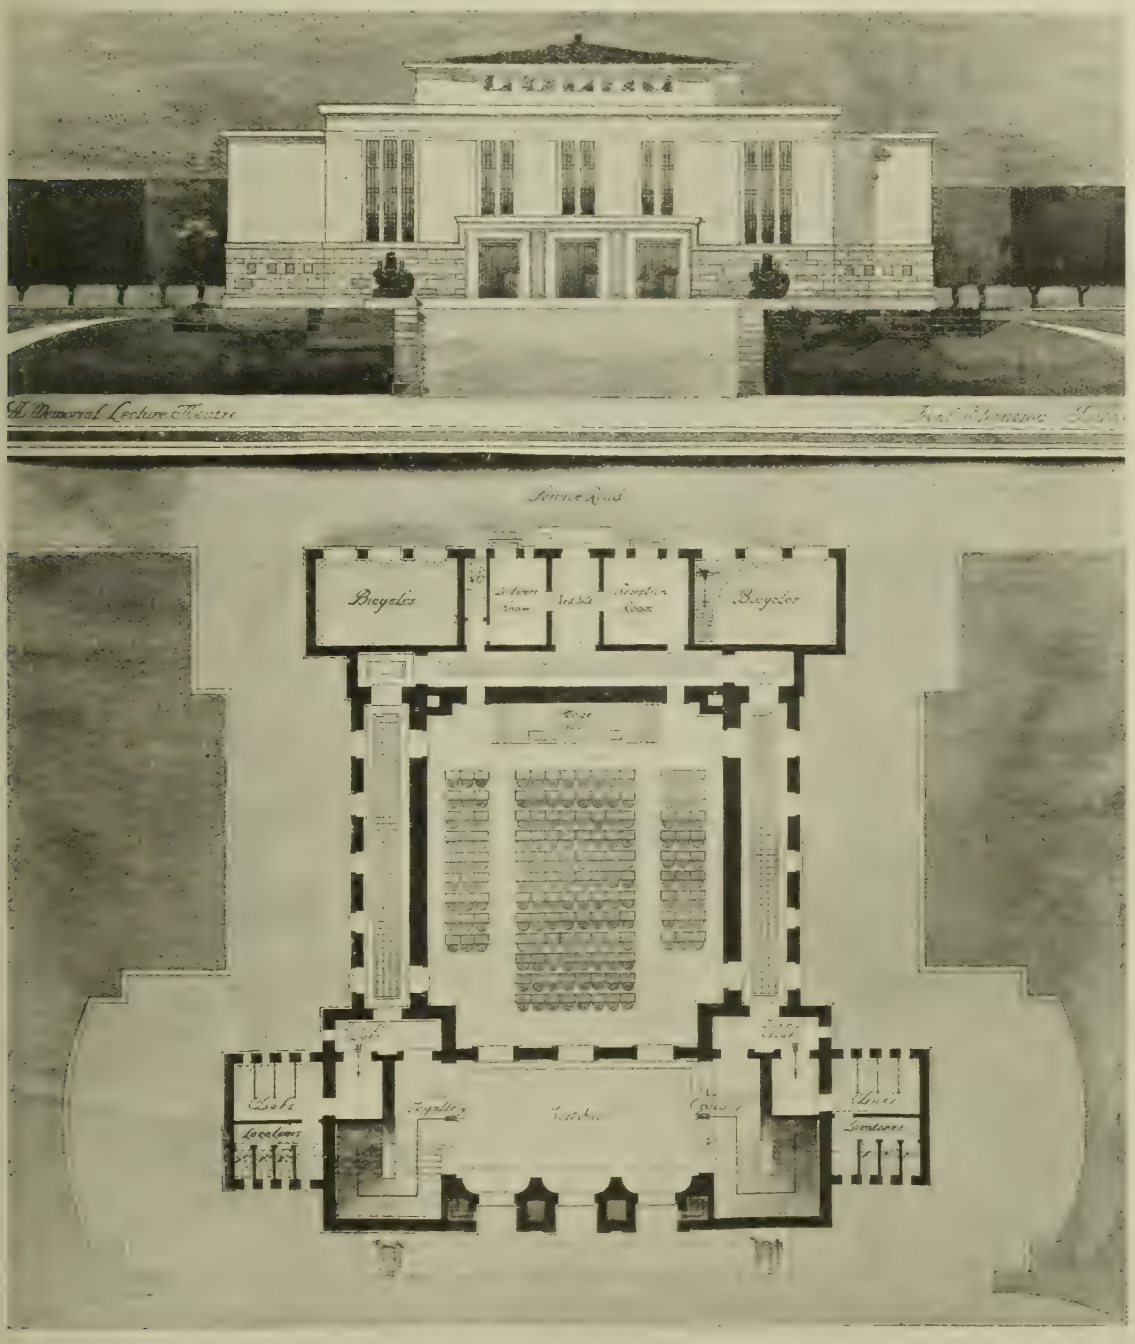
If we could only discount the plausible phrases of professionalism, which really mean so little to the artist, and which are yet so attractive to certain minds, we should be so much nearer the goal. Unfortunately, the proper background of the arts, which is one of quietness and study, and which justifies itself through deeds—in which sense it is only the artist can encourage art—finds now so much of its advocacy through those living more in the public eye, but outside its more properly secluded atmosphere, and suffers from such friends. I am not without hope, however, that public opinion, awakening to the realities of art, as to much else, is directed to seeking for its art where it may be found, trusting the artist to give him out of the treasury of his experience what will express their own best selves. There is a better prospect for mural decoration in this attitude than in any artificial fostering away from the facts of life. As we look deeper into ourselves and towards the new projections of the national life, which the new era foreshadows, we shall need the artist to interpret them, and the walls of our public buildings will then be the natural home of those themes which through form and beauty record and exalt its aspirations and achievements.

Town-planning Conference and Exhibition.

In connection with the Department of Town Planning at University College, London, a Town-planning Conference and Exhibition will be held in the Bartlett School of Architecture, from March 31 to April 5. The exhibition will be open all day, and the sessions of the conference will take place in the evenings. The programme will include addresses by Dr. Raymond Unwin, Mr. Geo. Pepler, Dr. I. G. Gibbon, and Mr. G. Topham Forrest. The exhibition will include the work of past and present students of the Department, and models and plans illustrating recent improvements and proposals relating to the planning of Greater London.

LEGAL SECTION.

NOTES ON CURRENT CASES.



Increase of Rent—Decrease of Rates.

A new and important point was raised in the case Strickland *v.* Palmer, upon which the Court said there was no reported decision.

The plaintiff was the landlord of a dwelling-house within the Rent Act at Upper Tooting, and he had sued the defendant, his tenant, in the County Court for £4 7s. 6d. arrears of rent. It appears that in June, 1921, the rent had been validly increased in part to meet an increase in the rates and that the defence to the action was that as the rates had since been reduced the tenant was no longer liable to pay this increase. The Court held that there was no provision in the Act enabling the tenant, when once the rent was increased, to come again to the Court or to show that when once the rent had been increased it should automatically fall. Under the Act the landlord had to give notice to determine the tenancy and then under stringent conditions he was permitted to make certain increases of rent and became the landlord under a new implied tenancy, and there was nothing in the Act to show that this tenancy was for a limited time or came to an end on any contingency.

The argument really turned on section 2 subsection (1) of the Act of 1920, which provides "The amount by which the increased rent of a dwelling-house to which this Act applies may exceed the standard rent shall subject to the provisions of this Act be as follows (b) An amount not exceeding any increase in the amount for the time being payable by the landlord in respect of rates over the corresponding amount paid in respect of the yearly, half-yearly or other period which included August 3, 1914. . . ." It was contended that these words "for the time being" denoted the sum actually payable in rents by the landlord, and if the increase in rent was to continue the expression should have been "the time being," so as to continue the increase, but the Court intimated it was unable so to distinguish the two phrases as to find in the distinction a scheme for reducing the rent.

Before the Court heard this appeal a point

Rome Scholarship in Architecture, 1924—Preliminary Competition.

Design for a Memorial Lecture Theatre and Approaches. By Mr. Marshall A. Sisson (University of London) selected to compete in the Final Competition.

was taken that an appeal would not lie at all, but that the decision given in the County Court for the defendant was final and conclusive. It was argued that this question arose under those portions of section 2 subsection (1) which we have quoted above, and that it was provided by subsection (6) of the same section, "Any question arising under subsection (1), (2) or (3) of this section shall be determined on the application either of the landlord or the tenant by the County Court and the decision of the Court shall be final and conclusive."

The Court intimated that this was also a point of difficulty, but that the conclusion it had come to was that this was an ordinary action to recover arrears of rent to which the Rent Acts might afford a defence, but the Rent Acts did not interfere with the ordinary right of appeal from the County Court in its ordinary jurisdiction, but only made the decision of the Court final and conclusive where under the Acts the parties apply to the County Court Judge as arbitrator in matters of administration.

It would appear from this judgment that the administrative matters referred to include such questions as what increases are valid under section 2, the state of repair of the premises, and under section 12 (3) an apportionment to arrive at the standard rent, also under the Rent Restrictions (Notices of Increase) Act, 1923, under section 2 subsection (4) questions as to arrears of rent and deductions under that Act, but that when a legal increase is once in force it becomes recoverable by the landlord as rent in an ordinary action and a change in circumstances does not permit a review being demanded.

The question is, as the Court said, one of difficulty and it is somewhat complicated by a section in the Rent Act, 1923, which was not referred to in the report of this case, that is section 11 subsection (1), which provides "The County Court shall have power on the application of a landlord or tenant to determine summarily any questions as to the amount of rent, standard rent, or net rent of any dwelling-house to which the principal Act applies, or as to the increase of rent permitted under that Act or this part of this Act," but here again something in the nature of arbitration seems suggested, for subsection (2) of this same section refers to Rules to be made providing for any questions arising under or in connection with the principal Act, or this part of this Act, being referred by the consent of the parties interested for final determination by the Judge or Registrar of a County Court sitting as an arbitrator or by an arbitrator appointed by the Judge.

The decision as it stands is very important as had the contention of the defendant succeeded it would have deprived landlords of the ordinary right of appeal from the County Court in all cases where the amount of the rent due in respect of houses under the Rent Acts was in question.

Action By One of Two Joint Contractors.

We may refer to the case, Johnson *v.* Stephens & Carter, Ltd., and Golding (1923, 2 K.B., 857), but in doing so we must point out that it involved a point of practice only which was tried on the pleadings in the action, and therefore the allegations in the pleadings were not proved nor any facts substantiated.

The plaintiff in the statement of claim alleged that he was in partnership with the second defendant, Golding, carrying on business as painters and cleaners of glazed building-surfaces, and that in March, 1915, the defendants, Stephens & Carter, had entered into an agreement with him and Golding that upon Johnson & Co. receiving any orders for work of the description of that done by the firm, Johnson & Golding, they would give that firm the necessary particulars to enable the firm to tender for the execution of the work, and that they would do their best to obtain a contract with the ultimate principals and upon obtaining it would employ the firm to do the work.

Then it was alleged that in breach of that agreement in September, 1922, the defendants had repudiated that agreement and refused to perform it any further, and that in breach of the agreement they had employed other persons than the said firm, including Golding personally, to execute work of the above description without giving the firm an opportunity of tendering for it.

The pleadings also alleged that the defendants had conspired with Golding that he should commit a breach of the partnership agreement, and that they should commit breaches of the agreement of March, 1915, in pursuance of which the defendant company gave all the work to Golding personally or to other firms with intent to deprive the plaintiff of his interest under that agreement.

The statement of claim then alleged that the plaintiff had requested Golding to join as paintiff in the action, and upon his refusing to do so he had been made a defendant as a necessary party.

Golding had applied to the Court to have his name struck out of the action on the ground that the plaintiff had not offered him an indemnity against costs if he had consented to be joined as a plaintiff, and he asserted there was no valid cause of action against the defendant company, and the Judge at Chambers had ordered his name to be struck out, being of opinion that the offer of such an indemnity was a condition precedent to the right of one of two co-contractors to join the other as defendant against his will in an action for a breach of contract.

The case was carried to the Court of Appeal and the order of the Court below was discharged, and it appears from the judgments that the Court of Appeal laid it down that the general rule is that where one of two joint contractors refuses to join as plaintiff in an action for a breach of contract the party seeking to sue should offer the other an indemnity against costs, or, as Lord Justice Younger put it: "Exhaust all reasonable means of obtaining his consent"; and then if he still refuses he can be joined as a defendant; but the Court intimated there might be an exception to this rule and this case formed an exception for the allegation was that one of the co-contractors had procured the breach himself or had acted in some way in fraud or in wrong of the other contractor, and in such circumstances it would be wrong to hold that the plaintiff had no right to join the other co-contractor without having offered him an indemnity against costs. It was therefore decided that the action must proceed, with Golding joined as a defendant; but apparently, should the allegation made as to collusion and conspiracy fail at the trial and judgment be given merely against the other defendants, the company, for breach of contract, then Golding's position as to costs would be taken into consideration, for, as we have shown, for an ordinary action for breach of contract, he could only be joined as a party against his will on an offer of indemnity against costs.

Workmen's Compensation: Onus of Proof.

In our issue September 28 we briefly referred to the case Moore & Company *v.* Barkey, decided in the House of Lords. This case is now fully reported (1923, A.C. 790), and we may amplify our former note.

Barkey was an oncost worker in a colliery and at the time of the accident he was down the colliery with a night shift fireman, Gillespie. On the previous afternoon it had been reported to Gillespie that there was some gas in a section of the pit and it was Gillespie's duty to clear the gas away, and he was entitled to call upon Barkey to assist him and Barkey was bound to comply.

Gillespie had a Glennie safety oil lamp which discloses the presence of gas by burning low or going out, but Barkey had an electric lamp which gives no such indication.

An explosion occurred and a rescue party went down the pit and the safety lamp was found in two pieces. This could not have been caused by the explosion because the lead rivet had been removed and the bottom of the lamp had been unscrewed from the top; and as is stated in the judgment, the natural inference was that the lamp had gone out and someone must have taken it apart with the intention of re-lighting it. Barkey's electric lamp was found still alight near the coal face, the top of the Glennie lamp fifteen feet farther away from the coal face, the bottom of the lamp 18 ft. from the face, Barkey's body 30 ft. and Gillespie's 50 ft. from the coal face, their heads turned away from it. These objects and the two bodies were nearly in a straight line. On the following day a small tin box with matches was found between the two portions of the Glennie lamp, but evidence was given by the lamp man that Gillespie left a wooden pipe and a box of matches in the lamp-room and Gillespie's son stated that he had never known his father to carry such a tin box for any purpose.

It would be a breach of section 34 of the Coal Mines Act, 1911, subsection (1) (iii) to unlock a safety lamp except at an appointed lamp station, and it must be unlocked or relighted only by a competent person appointed in writing by the manager.

The Sheriff Substitute in Scotland had held that there was no doubt that the accident arose "in the course of" the employment but that Barkey's dependants were bound to prove that it "arose out of" the employment, and they had not discharged the onus of proof put upon them and therefore compensation could not be recovered. The Second Division of the Scotch Court of Session reversed this decision and on appeal the House of Lords affirmed the Court of Session.

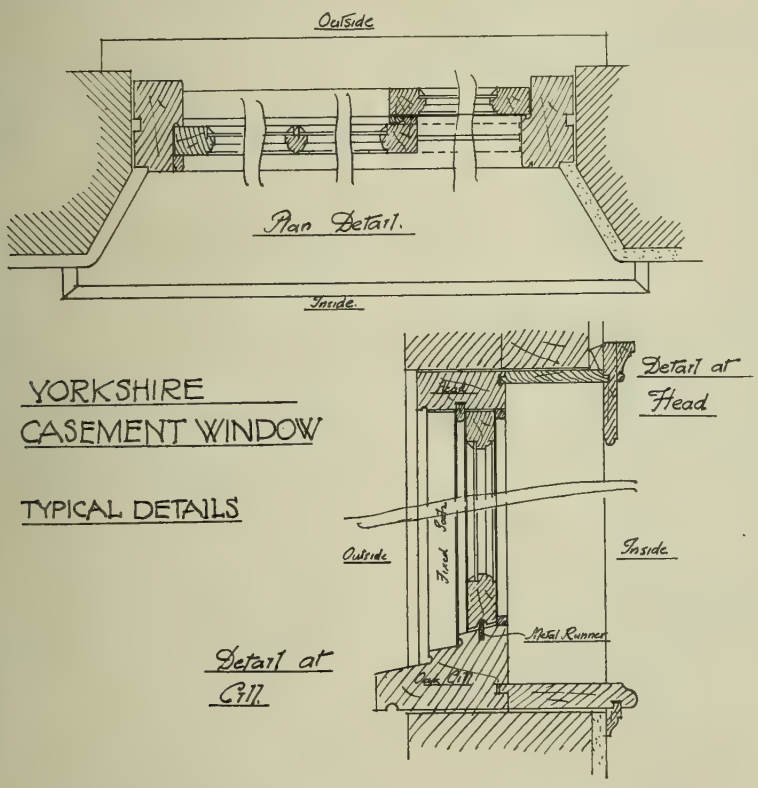
The House of Lords held that there was *prima facie* evidence that Barkey was acting in the course of his employment and that the accident arose out of the employment as he was doing the work he was engaged to do, "driving out gas," and that being the case it was for the employers to prove that Barkey had added a peril or done something which took his action outside the scope of his employment.

Under the new Act, which comes into force January 1, 1924, by section 7 the fact that a man at the time when the accident happened was acting in crontravention of any statutory or other regulation applicable to his employment, or of any orders given by or on behalf of his employer, or that he was acting without instructions from his employer, will no longer be a defence to a claim for compensation "if such act was done by the workman for the purposes of and in connection with his employer's trade or business," where the accident results in the death or serious and permanent disablement of the workman.

The section provides that notwithstanding that the workman was so acting such an accident "shall be deemed to arise out of and in the course of the employment." It will thus be easier for a *prima facie* case to be established on the part of the workman and the onus of disproving it which is laid upon the employer will be increased. The onus of proving serious and wilful misconduct has always been laid upon the employer (Johnson *v.* Marshall, 1906, A.C. 409, *The Builder*, May 26, 1906), and as we have shown in our note to Johnson *v.* Marshall and in subsequent cases in the House of Lords (Bourton *v.* Beauchamp, *The Builder*, June 25, 1920, and Moore *v.* Donelly, *The Builder*, May 27, 1921) the question of misconduct can only be raised where the man is acting within the scope of his employment. The case now decided in the House of Lords adopts the same principle to cases where it is desired to be proved that the accident did not arise out of and in the couse of the employment; when once a *prima facie* case has been established on behalf of the workman it is for the employer to prove circumstances furnishing a defence, and under this section of the new Act it would almost appear that serious and wilful misconduct will be the only available defence, for although it was possible heretofore definitely to prove a disobedience to orders, the onus now laid upon the employer under section 7 of the new Act seems to go to the extent of disproving that an act done in contravention of orders was done by the workman for the purposes of the employer's trade or business.

ARCHITECTS' AND BUILDERS' INQUIRY BUREAU.

*** We are glad to give questions and answers, but cannot accept responsibility for contributed replies, especially on legal matters.*



"Yorkshire Slides."

SIR,—Will any architect who has had experience with "Yorkshire Slides" kindly say whether they are weather-tight? A sketch detail would be appreciated.

G. HOLLINS.

[REPLY.]

We take it that our correspondent refers to the more generally known "Yorkshire Casement" or "Yorkshire Sash Window." The accompanying sketch illustrates a good weather-tight variety of this form of window, and we think explains itself. The main points to remember are that the fixed sash must be the outer one, and the sill must be properly weathered. A good modern improvement on this type of window would be to form an interlocking "hook" joint at the meeting stiles, similar to the meeting rails of a sash window, and to slide the window on ball runners.

Well-made, this window can be as weather-tight as any other form of wood window, but the old varieties are seldom sweet running and are liable to bind, and we seldom find them used in modern work.

It is interesting to note that Mr. J. Grieve, of Liverpool, writes in the February 9 issue of the R.I.B.A. *Journal* in very high terms of the "Yorkshire Sash Window," which letter Mr. Hollins will, no doubt, be interested to read if he has not already done so.

Provisional Amounts.

We understand from a correspondent the case Young & Co. *v.* White (1911) was overruled in the Court of Appeal in Hampton *v.* Glamorgan County Council (*The Builder*, June 2, 1916), and the decision of the Court of Appeal was affirmed by the House of Lords (*The Builder*, March 2, 1917).

Walls of a Small House.

SIR,—I should be glad to have opinions as to the following proposal for the outer walls of a small house to be built in an exposed position. Squared stone rubble walling 12 in. thick, built, or at any rate pointed, in cement, 2 in. or 2½ in. cavity and 4½ in. clinker breeze blocks, 32 in. or 16 in. by 9 in. by 4½ in. It may be doubtful as to wet penetrating through the 12 in. walling. Would it be possible that damp should appear through the clinker breeze by reason of condensation? Should the cavity be ventilated? Is this ever done? If not, would the inner lining be likely to be charged by more moisture than could be absorbed without showing itself on the inside?

The roof is of stone slate. There should be no question about the foundation, as the walls would be practically upon the rock, but presumably there would be a tendency to unequal settlement of the outer and inner walls. Would it be better to put the plate on the inside of the outer walls?

J. A. E.

MEETINGS.

MONDAY, *March* 3.

Royal Institute of British Architects.—Election Royal Gold Medallist. At 9, Conduit-street, W.1. 8 p.m.

WEDNESDAY, *March* 5.

L.C.C. Central School of Arts and Crafts.—Sir Banister Fletcher on "Roman Architecture." At Southampton-row, W.C.1. 6 p.m.

Royal Society of Arts.—Major-General Sir F. Ware on "Building and Decoration of the War Cemeteries." At 18, John-street, Adelphi, W.C.2. 8 p.m.

Institution of Heating and Ventilating Engineers.—Mr. A. A. H. Scott on "Heating and Ventilating applied to Ferro-Concrete Buildings." At 38, Victoria-street, S.W.1 7 p.m.

THURSDAY, *March* 6.

Liverpool Architectural Society.—Mr. W. Milburn, jun., on "Hospitals." At 13, Harrington-street.

Incorporated Institute of British Decorators.—Mr. W. H. Cantrill on "A Pilgrimage to the Hill Towns of Umbria." At Painters' Hall, E.C.4. 7.30 p.m.

YORK AND EAST YORKSHIRE ARCHITECTURAL SOCIETY.

THE York and East Yorkshire Architectural Society held their annual dinner at York on February 15. Amongst those present were Mr. Stephen Wilkinson (President), Mr. J. Alfred Gotch (President of the Royal Institute of British Architects), Mr. W. T. Jones (President of the Northern Architectural Association), Mr. Ian MacAlister (Secretary of the R.I.B.A.), Dr. Evelyn, Dr. Collinge, D.Sc. (Keeper of the Museum, York), Mr. J. E. Reid (Hon. Sec., York Society), Mr. E. A. Pollard (Hon. Treasurer, York Society), Mr. George Benson, Mr. F. T. Penty, Mr. J. Oldham, Mr. J. M. Dossor (Hull), Mr. S. R. Kirby, Mr. L. Kitchen (Hull), Mr. Dudley Harbron (Hull), Mr. A. B. Burleigh, Mr. J. S. Syme, Mr. S. C. Highmoor, Mr. A. Cowman, Mr. S. Needham, Mr. C. W. C. Needham, Mr. W. E. Parkinson, Mr. R. Jackson, Mr. C. Leckenby, Mr. J. Vause, Mr. H. Monkman, Mr. T. Snowden (Hull), and Mr. T. E. Cliffe.

Mr. Stephen Wilkinson, in proposing the toast of the R.I.B.A., extended a cordial welcome to Mr. Gotch.

Mr. Gotch, outlining points which might possibly be considered by the Institute in the near future, hinted at the possibility of fusion with the Society of Architects. Personally, he saw no reason why the two bodies should not work as one for the benefit of architecture. The Institute was not run by architectural politics, the members were really striving single-heartedly for the benefit of the profession. United and widespread action would vastly advance the interests of architecture and architects.

Mr. L. Kitchen, welcoming the suggestion that fusion might be possible in the near future, pointed out that when the profession was absolutely united it would be able to go before Parliament with a reasonable chance of its demands being accepted.

ROMAN DECADENCE.

SIR BANISTER FLETCHER lectured at the Central School of Arts and Crafts recently on the construction and equipment of the great Roman thermæ, or baths, and revealed the love of luxury which gradually gnawed at the vitals of Roman power and progress.

These gigantic thermal establishments showed those old Romans as past-masters in matters of water supply, central heating, and complicated planning of baths designed to minister to the pleasure needs of a population that emperors sought to placate. The old spirit which had made Rome the mistress of the world was flickering out, and men's minds were turned from arms and war in distant provinces to the pursuit of pleasure and personal indulgence, and these magnificent and monumental buildings were the last word in luxurious living, providing as they did not only for bathing and its attendant services, but also for amusement, exercise, lounging, gossip, and even lecturing; and in these marble halls and colonnades the gilded youth of Rome chatted over the news from the front and criticised the Government at home.

Buildings designed to meet such complicated requirements involved a fresh development in architectural planning, and they could only be carried out by using slaves for labour and concrete for material. The Thermæ of Caracalla formed the first great Roman structure which resembled in its complicated character a modern architectural plan. The central block, with its central tepidarium, flanked by the frigidarium, calidarium, and countless chambers and corridors, was as vast as that of Westminster Palace, including the Great Hall itself.

Similar baths were erected throughout the Roman Empire, at Pompeii, Italy, Timgad, Africa, even Bath itself, in our own country; and substantial remains existed at the present day to remind us of their former magnificence.

EXHIBITION NOTES.

THE ERICKSEN DRAWINGS.

THERE was something refreshingly dainty and charming in the drawings by Kay Ericksen, at the Leicester Galleries. What we like most about them is their delightful colour and decorative quality—a wonderful variety of delicate colour and drawing is at the artist's ready command. The fantastic and weird presentment of the themes will probably find many admirers, but no architect or decorative artist could fail to appreciate the singular charm of refined drawing and colour which is to be found in all the subjects : especially delightful are Nos. 1, 8, 30 and 37. Even where the subject is as gruesome as in No. 12, the beauty of the colour and the drawing redeem the sorrowful tale that is told, where even the nightingale cannot wake the dead, though it charms death.

PRINTS AND DRAWINGS.

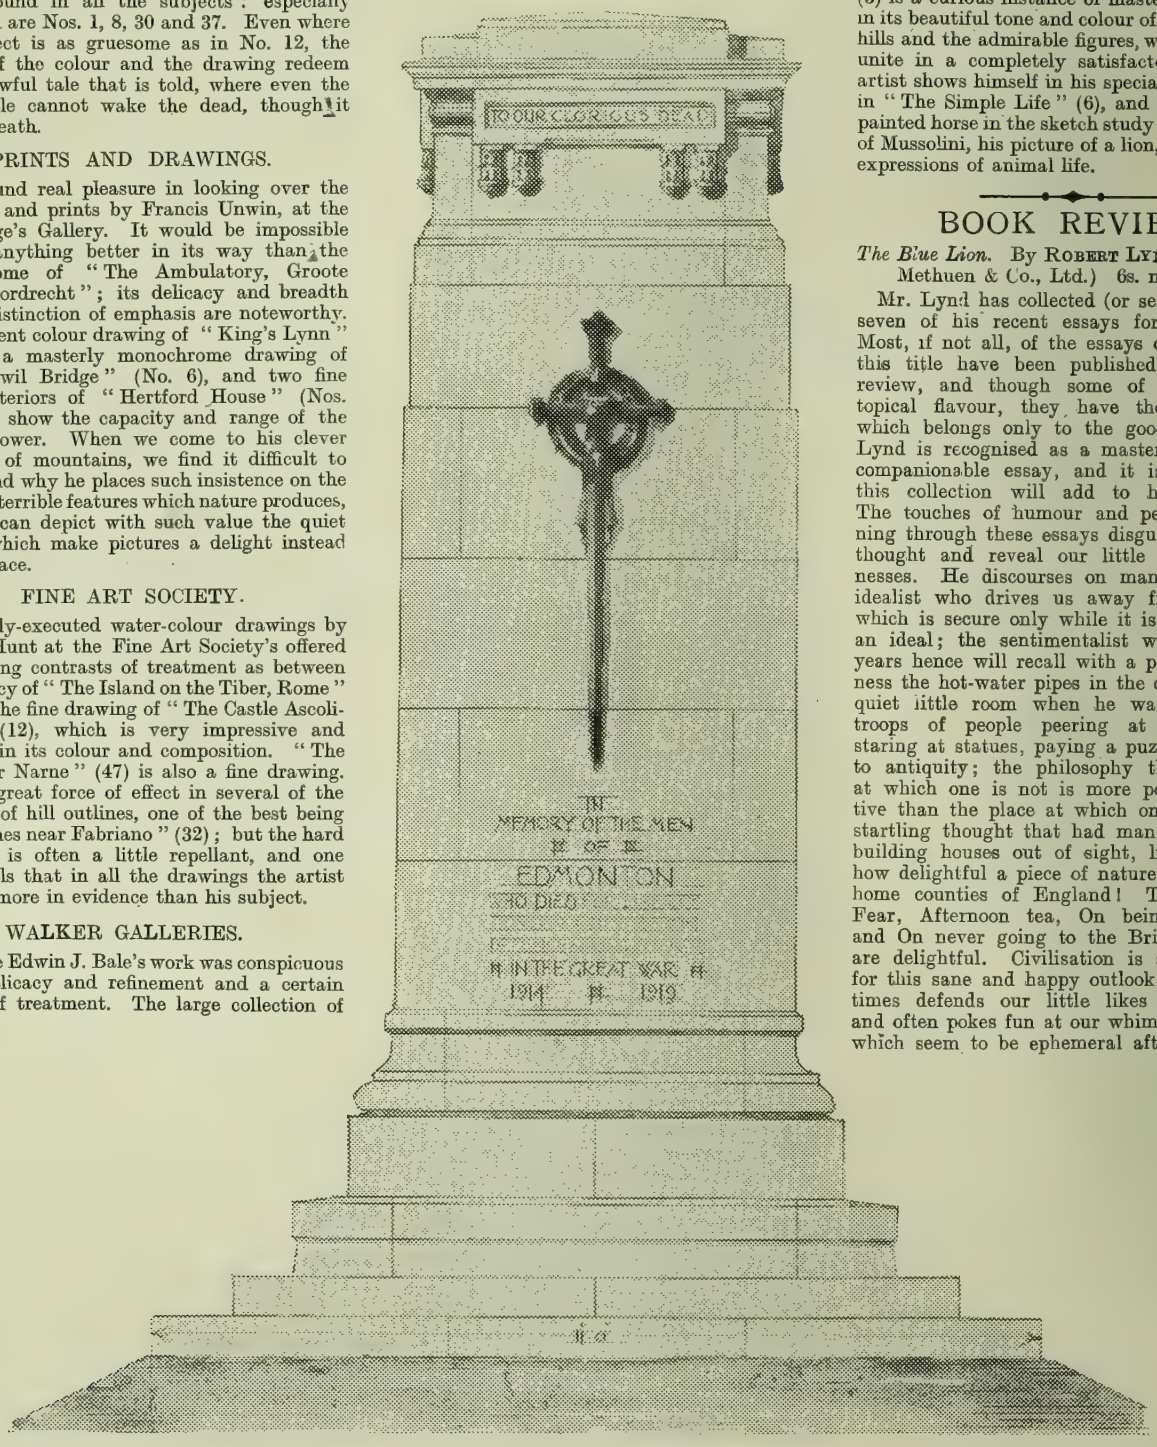
We found real pleasure in looking over the drawings and prints by Francis Unwin, at the St. George's Gallery. It would be impossible to find anything better in its way than the monochrome of "The Ambulatory, Groote Kerke, Dordrecht"; its delicacy and breadth and its distinction of emphasis are noteworthy. An excellent colour drawing of "King's Lynn" (No. 7), a masterly monochrome drawing of "Wilderswil Bridge" (No. 6), and two fine telling interiors of "Hertford House" (Nos. 18 & 19), show the capacity and range of the artist's power. When we come to his clever drawings of mountains, we find it difficult to understand why he places such insistence on the volcanic, terrible features which nature produces, when he can depict with such value the quiet charms which make pictures a delight instead of a menace.

FINE ART SOCIETY.

The ably-executed water-colour drawings by Cecil A. Hunt at the Fine Art Society's offered some strong contrasts of treatment as between the delicacy of "The Island on the Tiber, Rome" (17) and the fine drawing of "The Castle Ascoli-Picens" (12), which is very impressive and excellent in its colour and composition. "The Cliffs near Narne" (47) is also a fine drawing. There is great force of effect in several of the drawings of hill outlines, one of the best being "Apennines near Fabriano" (32); but the hard definition is often a little repellant, and one rather feels that in all the drawings the artist is rather more in evidence than his subject.

WALKER GALLERIES.

The late Edwin J. Bale's work was conspicuous for its delicacy and refinement and a certain ideality of treatment. The large collection of his water-colours at Walker's Galleries affords a pleasant reminiscence of his work; now, alas! ended. Two of his very best pieces are amongst the collection and rank high in the achievements of modern water-colour art. Two other collections of water-colour drawings are now on view at these galleries. Those by J. S. C. McEwan Brown are largely from North Wales and exhibit some skill in effects, but the colour is not very attractive, and most of the drawings suffer from hardness and over-definition. The studies from the Riviera, &c., by Ella M. Fraser show a vigorous broad handling, and some, as Nos. 23 and 26. have a definite colour value.



VACCARI'S PICTURES.

The real character of animals is rarely depicted so well as we see in the small collection of paintings by Signor Vaccari at the Fine Art Gallery, 18, Cork-street. The figures of animals are the strong objective, though the character of landscape is often very vividly and truthfully expressed, as in the picture of sunny meadows with a background of blue hills (5), where the whole effect of light, atmosphere, colour and texture is a somewhat rare combination of values. In many of his paintings we do not find the colour quite to our liking, but the picture here referred to shows what the Signor can do at his best. "The Wandering Minstrel" (3) is a curious instance of masterly work, both in its beautiful tone and colour of the mysterious hills and the admirable figures, which yet fail to unite in a completely satisfactory way. The artist shows himself in his special vein of talent in "The Simple Life" (6), and the brilliantly-painted horse in the sketch study for the portrait of Mussolini, his picture of a lion, and other fine expressions of animal life.

BOOK REVIEW.

The Blue Lion. By ROBERT LYND. (London: Methuen & Co., Ltd.) 6s. net.

Mr. Lynd has collected (or selected) twenty-seven of his recent essays for this volume. Most, if not all, of the essays collected under this title have been published in a weekly review, and though some of them have a topical flavour, they have the rare charm which belongs only to the good essay. Mr. Lynd is recognised as a master of the light, companionable essay, and it is certain that this collection will add to his reputation. The touches of humour and personality running through these essays disguise the serious thought and reveal our little human weaknesses. He discourses on many things: the idealist who drives us away from the ideal which is secure only while it is recognised as an ideal; the sentimentalist who a hundred years hence will recall with a pang of tenderness the hot-water pipes in the corner of some quiet little room when he was a boy; the troops of people peering at pictures and staring at statues, paying a puzzled reverence to antiquity; the philosophy that the place at which one is not is more potently attractive than the place at which one is; and the startling thought that had man the power of building houses out of sight, like the birds, how delightful a piece of nature would be the home counties of England! The essays on Fear, Afternoon tea, On being rather ill, and On never going to the British Museum, are delightful. Civilisation is all the better for this sane and happy outlook, which sometimes defends our little likes and dislikes, and often pokes fun at our whims and fancies, which seem to be ephemeral after all.

Edmonton War Memorial Competition.

[This memorial will be executed in Cornish grey granite with bronze sword on the front. It will be 17 ft. high, and weigh about 25 tons. This design, by MESSRS. GRIFFITHS & CO., LTD., together with a tender for the erection of the memorial, was recently accepted by the War Memorial Committee. Our illustration is from the *Tottenham and Edmonton Herald.*]

THE WEEK IN PARLIAMENT.

Westminster, *Wednesday.*

Private Enterprise.

In connection with the Supplementary Estimates for the Ministry of Health, required to make good a loss suffered by the Public Works Loan Commissioners, Mr. Wheatley said that the Ministry advanced money for housing purposes when the rate of interest was six per cent. The houses were sold by the societies, and the money advanced was repaid at a time when the rate of interest on re-investment was only four per cent. Part of the money was required to meet expenses under the Housing Act of 1923.

Replying to criticisms, Mr. Wheatley pointed out that the late Government wished to encourage the sale of houses, and gave special terms to public utility societies under the Act of 1923. There had been a larger sale than had been anticipated. As to the housing position under the Act, the Ministry had issued up to date certificates for the building of 98,349 houses, and of that number 63,870 had been granted to private enterprise and 34,479 to local authorities. The issue of certificates to private enterprise meant merely that the local authorities represented that they believed they could place certificates with the right builders to secure the erection of, say, 10,000 houses in a particular district, and as 10,000 houses were wanted there the Ministry gave approval. The number of certificates actually taken out up to the present by private builders was only 33,044. In regard to the 34,479 certificates taken out by local authorities, the plans of only 18,687 houses had been approved. It did not rest with him to define who formed the working class and who should be assisted in regard to housing, but obviously the limited sum available should be spent in assisting those who most needed help. The Government had been asked to extend public aid to housing for the middle class. At present the State might leave that task to private enterprise, which should be ashamed to ask for State aid. Private enterprise subsidised showed the failure of private enterprise. Apart from the comparatively small numbers of houses being built in connection with factories, practically all the houses to be erected by private enterprise and helped by the State to be let when completed was only about 20,000. The total number of houses on which work had been started was 22,600, and the number completed was only 4,608. As to the question of density, Mr. Wheatley said he would never dream of approving a density of even 30 houses to the acre. He had been asked to pledge himself to a density of 16 houses to the acre, but all he said was that hon. Members would find him sympathetic on that question.

The Director of Housing.

In reply to Mr. Costello, who asked whether Sir Charles Ruthen was still honorary director of housing, Mr. Wheatley said that the answer was in the affirmative. Sir Charles Ruthen was appointed Director-General of Housing in a voluntary capacity by the then Minister of Health on April 20, 1921. He received an allowance of £500 a year to cover his out-of-pocket expenses while living in London, and the cost of a season ticket between London and Swansea. The total amount so paid to him since his appointment was £1,796 15s. He was at present responsible for the general control of the arrangements for the approval of housing schemes carried out by local authorities and for advising the Minister on technical matters arising in connection with housing administration.

Unfit Houses.

Mr. Wheatley informed Mr. C. Wilson that, according to statistics obtained from the reports of Medical Officers of Health for the year 1922, 15,867 houses in England and Wales were found to be unfit for human habitation.

Size of Houses.

Mr. E. Brown asked whether any municipal authorities had made representations as to the desirability of increasing the size of houses to which the Government subsidy applied.

Mr. Wheatley said that in a few cases representations to this effect had been made by local authorities.

The 1923 Act.

Mr. Wheatley informed Mr. D. Millar that up to December 31, 1923, local authorities had issued certificates authorising the erection of 25,188 houses by private enterprise under the Housing, &c., Act, 1923; 1,110 houses had been completed, and a further 6,657 were under construction. At the same date, 31,434 houses had been authorised in schemes to be carried out by local authorities under the Act; 1,998 had been completed, and a further 6,606 were under construction. Those figures did not include houses erected to replace dwellings included in slum clearances. Tenders for the erection of 1,108 houses or tenements had been approved since the beginning of 1923 in connection with slum clearance schemes.

Consolidation Acts.

Mr. Wheatley stated that a Bill to consolidate the Housing Acts was in course of preparation.

The New Rent Bill.

The new Rent Restriction Bill, introduced by Mr. B. W. Gardner, a Labour Member, has been read a second time in the House of Commons by 248 votes to 101. Mr. Gardner explained that the measure was frankly a tenants' Bill, just as the 1923 Bill was frankly a landlords' Bill. It proposed to extend control to 1928. The 1923 Act expired next year, but there was still a great shortage of houses. Even a Labour Government could not hope to catch up with that shortage by 1925. The Bill proposed to lay down the grounds on which a landlord could obtain possession. Under the present Act landlords were doing almost anything they liked, and evictions were going on all over the country. The Bill proposed to take away all the grounds for obtaining possession except where a landlord wanted the house for his own occupation, and in that case the landlord had to provide alternative accommodation. Under the present Act, a 15 per cent. increase on standard rents was allowed; this would be reduced to 10 per cent. in accordance with the fall in the cost of living. At present the landlord was allowed 25 per cent. for repairs; the Bill proposed to reduce this to 15 per cent., because it was notorious that the landlords drew their 25 per cent. and did not carry out their repairs. The Bill proposed to put back into control all the houses included in the 1920 Act. He alleged that there was a hold-up of cottage property all over the country.

The Unionists moved an amendment, urging that the Bill should be rejected until a full inquiry had been held into the working of the 1923 Act, and the nature and extent of any alterations that might be advisable. Part 2 of that Act, it was stated, had been ignored. Mr. N. Chamberlain (a former Minister of Health) and Sir Thomas Inskip supported the amendment, the latter stating that the Unionists would do their best to make it possible for private persons to build and own houses.

Mr. Wheatley, in strongly supporting the Bill, said the days of private owners investing capital in houses to be rented by the working class had gone for ever. But the economic circumstances of probably three-fourths of the community were such that they had to depend for housing accommodation on their ability to rent, and it was the provision of houses for that section that he wished to direct attention. The amendment which had been proposed was not honest. Of all the defects of the Bill, there was only one from the tenants' point of view, and that was that it would reduce the rents of working-class houses. He advised the Unionists that to make a slight concession would be good business for them. The Government took no responsibility for the measure beyond the second reading stage.

The amendment was rejected and the Bill read a second time.

Building Material Prices

Sir Kingsley Wood asked the Minister of Health whether he proposed to continue the inter-departmental committee appointed to survey the prices of building materials.

Mr. Wheatley said the question whether this Committee should be continued in its present form or whether there should be an extension of its scope and powers was under consideration. The arrangements made by the Committee for the collection of information as to prices were being continued.

Working Class Houses.

Mr. Wheatley informed Sir H. Cautley that detailed statistics were not available of the number or cost of working class houses built last year by private enterprise without subsidy. A return obtained from the local authorities for the six months ended September 30 last showed that in that period 20,982 houses had been completed of not more than £26 rateable value in the provinces, and not more than £35 in the Metropolitan Police District. A similar return obtained in March, 1923, showed that 9,971 similar houses had been completed by private enterprise in the period from October 1, 1922, to March 1, 1923. This return did not include building in the areas of rural district councils. From these returns it appeared that in the year ended September 30, 1923, the number of small houses of the type described which were completed within the year was not less than 31,000.

Apprentices.

Mr. D. G. Somerville asked the Minister of Labour whether, seeing that hitherto there had been a limitation of apprentices bound to craftsmen of one in seven, with a maximum of eight to any craft in any firm, and such regulations hampered the rapid construction of houses, he was using his influence to induce the unions concerned to modify in the public interest these restrictions.

Mr. T. Shaw said he could not accept the statements in the question, but as the hon. member was probably referring to the building trades, he might explain that the number of apprentices was much below the number permitted by the agreements between the employers' and operatives' organisations. These organisations had assured him of their co operation in the formulation of proposals by which the number of apprentices might be increased in accordance with the requirements of the industry, and he hoped to receive these proposals in the near future.

Indoor Painting.

Mr. T. Shaw informed Mr. Raffety that the Unemployment Grants Committee had given grants to public authorities to enable them to undertake during the winter indoor painting and other decorative work which ordinarily would not be carried out until the spring or summer. No form of assistance in this connection was, however, available for private employers. He agreed that if work of this character could be spread throughout the year it would be to the advantage of a number of workmen at the moment unemployed, but as regarded private employers he could do no more than call attention to the point.

Refuse for Bricks.

Commander Bellairs asked the Minister of Health whether he was aware that clinker refuse from destructors and electric light works was worked up abroad successfully and cheaply into bricks for building; and whether he would consider this method of relieving the brick shortage and obtaining cheaper houses.

Mr. Wheatley said he was aware that good clinker might be used successfully as aggregate for concrete, though it was difficult to form a judgment of relative cheapness of the process without reference to local conditions in the particular case. He had every hope that the brick industry would succeed in producing sufficient bricks to meet the housing needs, and he would welcome all action to that end on the part of the industry. Attention would, of course, be given to all promising methods of alternative construction.

THE BUILDING TRADE.

UNEMPLOYMENT INSURANCE.

An extremely important report has been made on the subject of Unemployment Insurance by the National Confederation of Employers' Organisations in reply to an invitation which was issued in 1922 by the then Minister of Labour, Sir Montague Barlow, to that organisation and the Trades Union Congress General Council to co-operate in considering the steps which might be taken with a view to establishing an improved system of Unemployment Insurance. It has been submitted to the present Minister of Labour. According to a digest of the report, published in the *Times*, February 5, after referring to the Royal Commission of 1905-9, it points out that the broader problems of reorganisation of Poor Law relief and its administration as well as the co-ordination of all forms of relief of distress, still remain to be undertaken in the light of the Royal Commission's report, and much of the unsatisfactory conditions for the relief of unemployment arises primarily from the absence of any well-defined co-ordination between Unemployment Insurance and Poor Law relief. In respect of both there have been, to meet admittedly unprecedented emergencies, hasty improvisations, based unfortunately on no common or settled principles, but whatever be the defects of the emergency measures, the experiment of Unemployment Insurance as initiated in 1911 cannot be adjudged a failure in itself, but on the contrary it has been proved that it is practicable in normal times to make provision for assisting the bona-fide workman over periods of temporary and unavoidable unemployment.

After these somewhat general observations the report turns to the question of

Insurance by Industries.

The report is strongly against any such system for the following amongst other reasons:

(1) A single administration of a uniform and general scheme ought to be more economical than the cost, direct and indirect, of the administration of schemes for separate industries;

(2) Compulsory insurance by industries is quite impracticable on any comprehensive scale: there would be considerable difficulty, in very many instances insurmountable, in the strict demarcation between industry and industry: a substantial proportion of workers move from industry to industry, there is also a substantial proportion of workers in respect of which there is no trade organisation, either on the men's side or the employers', and there are large numbers of workers in seasonal and casual employments;

(3) From a financial point of view it would not be practicable for even every well-organised industry to have a workable scheme. The industries which depend upon world markets suffer severer fluctuations than home trades: an industry having severe fluctuations could not offer the advantages given in an industry with low fluctuations, and disparity between contributions or benefits would create unrest: the segregation of industries has grave objections on the ground of general principle, for insurance is founded on the principle of averaging: Unemployment Insurance, if it is to be compulsory, should be universal and uniform: employers and workers in high-risk industries should not be saddled with the heavy burden it would involve unaided by the low-risk industries.

In connection with the question of insurance by industries, the report also points out that the question has been raised in another form, that is, whether unemployed insurance should be on the basis of like contribution and benefits for all workers, or of higher contributions and benefits for the higher paid workers. The reply to this question is that the compulsory scheme should not discriminate between the workers: it is the lack of opportunity of the unskilled and low-paid workers to make provision for themselves which makes a call on the State and the employer necessary: the higher paid worker has other opportunities of making provision of his own against the risk of unemployment, and if additional benefits are to be provided for him it should be by supplementary schemes.

Finance.

The report suggests that the State contribution should be increased and should be the same rate as that paid by the employer and worker, and this increase would allow of improvement in the number of weeks for which benefit would be paid. It is also suggested that the refund system should be abolished, and vested interests should be met by some other compensatory advantage.

Labour Exchanges.

The report points out that when a national system of Labour Exchanges was inaugurated in 1909, it was contemplated that through their machinery there would be accurate contemporary information about demands for labour, and that the labour department would act as a sort of intelligence bureau, co-ordinating and distributing Government contracts and municipal work, so as to act as a counterpoise to the unemployment in the labour market, and that schemes of utility would be examined beforehand so as to be set on foot at any time, knowledge and consideration having been applied beforehand, but much of the weakness in the employment exchange administration of Unemployment Insurance has arisen from the fact that the larger policy has never been developed and matured.

The report observes that the results of allowing the trade unions to administer the insurance fund is that skilled men are kept aloof from the employment exchanges, and thus the exchange system had been prejudiced and brought into disrepute, and it recommends that both on financial grounds and in the interests of the efficiency and usefulness of the employment exchanges they should be the sole administrative authorities.

The report suggests that even if industry is not as yet prepared for the compulsory registration of vacancies or the compulsory registration of workers at the exchanges, there can be no reason why firms should not be obliged to intimate to the employment exchange within a certain number of days the engagement of any workers, and we may add to this suggestion that equally the dismissal of employees might also well be notified.

The Younger Generation.

At a time when the unemployment of the youth of the nation is a cause of anxiety, we may note that the report on this question suggests that jurisdiction over juveniles should not be divorced from the general scheme of unemployment machinery, and it appears to consider that the present conflict of jurisdiction between the education authorities and the employment exchanges has an injurious influence on the efficiency of the exchanges.

Amalgamation of Social Services.

In conclusion the report deals with a suggestion that Unemployment Insurance might be amalgamated with one or more of the social services, but it points out that Unemployment Insurance is not so related either in principle or in substance to Health Insurance, Workmen's Compensation, or Old Age Pensions as to make an amalgamation desirable, but what is really needed is such co-ordination between Unemployed Insurance and Poor Law Relief as will prevent overlapping and confusion, and will ensure that both thrift and charitable aid are preserved as part of the general scheme.

This is only a very brief summary of some of the points raised in this very instructive report, but it will suffice to show it is well worthy of very careful consideration at this time when unemployment is to be one of the chief questions dealt with by the Government.

SOUTH WALES BUILDING TRADES FEDERATION.

The annual dinner of the South Wales (Regional) Federation of Building Trades' Employers was held at Cardiff recently. Mr. T. J. Chorley, the newly-elected president, was in the chair, supported by the Lord Mayor of Cardiff (Ald. S. Jenkins) and Messrs. W. H. Nicholls (president of the National Federation), W. J. Nash, Ivor P. Jones, W. S. Purcheon, W. Douglass May, S. E. Clutterbuck, D. Pugh Jones, G. A. Phillips, F. C. Swash, A. Bennett, C. S. Thomas, and Principal Charles Coles.

"The City and Trade of Cardiff" was proposed by Mr. W. E. Goodridge (Neath) and responded to by the Lord Mayor of Cardiff.

Mr. C. S. Thomas proposed the "National Federation of Building Trades' Employers," to which Mr. W. H. Nicholls responded.

Mr. Nicholls said that whilst the trade recognised the acute scarcity of skilled craftsmen that existed, it found it a difficult matter to decide whence this labour was to be obtained. The necessary number of apprentices would not be able to be trained until there was stability in the industry. The whole trouble lay in the non-stability of the industry. The Federation was working to bring about stabilised conditions, for unless skilled craftsmen were produced in large numbers the building industry must go under. On the shoulders of the builders rested the responsibility for their production. Some of them had misgivings when the Government change came about, but it was only fair to say that these had been tempered by the wisdom that the Government had shown in approaching the problems with which it was faced. Everyone would admire the tact shown and he asked the builders to approach the problem with sympathy and not in a spirit of interference.

The Government, continued Mr. Nicholls, realised they could not give the opportunity to industry to go forward without the aid of the builders. The Government intention was to provide houses, and they could not do so unless the builders helped them. Would they help or hinder? He addressed his appeal equally to both sides, and that meant placing on the shoulders of the operatives and the employers the responsibility of the present housing position. The building trade could not go forward without increased personnel. He saw in the newspapers that they were asked for 200,000 houses, and they could take it that for every house required per annum the additional men required to be employed would be equal to that number, and that 200,000 houses would mean that 200,000 additional men would be required. By reason of many years of hard work and organisation the trade unions were in a position to hold a monopoly and they did not desire to give up that monopoly unless their members were protected. They were afraid of the menace of unemployment. The present problem, he continued, would require sincerity and determination to overcome it. They wanted bricklayers, plasterers, painters, carpenters and plumbers, &c. If it was solved it would greatly relieve the unemployment position and result in demand for increased coal and every material used in building and be of advantage generally to the country. If labour took the opportunity presented to raise the prices of labour because of their monopoly houses could not be obtained, and he appealed to wise labour leaders to stay their hand for the present, and appealed to employers knowing the need of the country not to create corners or form rings, but to jointly make every effort to solve the present building problem.

MODERN BUILDERS' MACHINERY.

By STAFFORD RANSOME.

No. V.—THE SCOPE AND LIMITATIONS OF THE "GENERAL JOINER."

The "General Joiner" is not always the first machine that a builder puts down, although such is very often the case. It must, however, be given precedence over the individual machines, not because it is better than they, for in no circumstances can it be as good, but because it claims to be a complete small builder's plant in itself. In a measure, except for curve sawing, it may be said to justify that claim, but it should be clearly understood that the best general joiner ever made cannot possibly be as efficient or as convenient to work as are separate machines. There is another reason why we must give the joiner the first place in describing builders' plant, and that is because the builder has made this versatile tool essentially his own. It is he who is the purchaser of nine-tenths of those that are made and, although sometimes he has been ill-advised to put one down at all, even in the very early days, he often develops such an unshakeable affection for it that he clings to it long after he ought to have discarded it in favour of individual machines

Devotion to the "Joiner."

I remember one very accentuated case of such staunch devotion to the general joiner. This was a builder who began with one of these machines when he was in a small way, and, as he grew larger, he kept on adding others until he had quite a large saw-mill full of them. If I remember rightly there were more than a dozen in the same mill. In vain I endeavoured to persuade him to throw them out and adopt a much smaller plant of efficient individual machines for the different operations. He could have done twice the work with two-thirds of the horse power, with far less labour and with an immense saving in floor space. For many years he went on with that policy. He went on—and prospered. His business, as he very truly stated, "had been built up on the general joiner," but it would have been built up far more rapidly had he adopted more efficient machines after the joiner had given him his start.

There are distinct "fashions" in wood-working machinery just as there are in hats. The frame saw, which for a long time was virtually killed in America by the band mill, has suddenly come to life again. The chain mortiser, which gained but little favour for twenty years after its invention, is all the rage to-day. But, no matter what changes in fashion may occur, nothing seems to kill the general joiner, just as nothing kills altogether the top hat. Both are admittedly clumsy and technically unsound, but still they are with us and cannot be ignored. Further than this, they are made as a regular line and in fairly large quantities by several of the best known British manufacturers, and are bought by men who presumably know what they want and who find them profitable.

The Inception of the "Joiner."

It is a curious fact that, although the general joiner has for nearly seventy years had a highly prosperous life in Britain, it has never been taken up on any very large scale by the makers in other countries. Literally hundreds of different designs of general joiners have been put upon the market since Samuel Worssam & Co. brought out the first successful one in 1858, and they have been called "general," "complete," "universal," and all sorts of other "joiners" or "wood-workers" or "carpenters." Some of them have been a mere jumble of complicated mechanisms, awkwardly fitted to one ungainly central casting. Some are little more than a saw bench with an elongated spindle to take a cutter-block for planing and beyond that a slot-mortising arrangement, and possibly a vertical spindle for curved mouldings.

The Popular Type.

It is the joiner of this latter type which has survived and remains popular to-day as the simpler the design the more practically useful the machine will be, for the simpler machines are less inefficient and less inconvenient to work and adjust than the others.

Let us briefly run through the genesis of the joiner. All the earlier joiners were evolved primarily out of a plain saw bench, and they owe their inception to a desire to make a saw do more than it is legitimately entitled to do. Now, on a saw bench with a rising and falling table you can not only do any sort of ripping, flatting and cross-cutting, but you can also cut tenons, tongues, grooves, etc., and, at a pinch, if the spindle runs sufficiently fast, ordinary mouldings to a limited extent. But the man who has a saw bench as his first machine, especially if he is a builder, requires to do boring and mortising as well as tenons. So the saw spindle is prolonged and a slot mortising, or routing, tool is placed in it and a bracket with the necessary adjustments is added to complete this mortising apparatus. This is the first step towards the general joiner. So far no harm has been done, as the speed of the spindle may be arranged to suit both the saw and the routing tool, and both can be used independently of each other or simultaneously by two men working one on each side of the machine. They do not interfere with each other in any way except that one may want to change the saw or the routing tool when the other would be getting on with his work. So even here there may be a certain loss of time.

A Makeshift Mortiser.

We must, however, bear in mind that as a general rule a builder does not want to do slot mortises, *i.e.*, mortises with rounded ends. Thus this slot mortising attachment, though it saves a good deal of hand labour, is far less efficient than a suitable independent mortising machine of a better type. As a matter of fact, there are three types of mortising machines, any one of which would be better for his purpose than the slot mortiser; notably the chain, the hollow chisel, and the reciprocating chisel machines. Thus, with the general joiner the user possesses, first of all, an efficient saw bench and boring machine and a comparatively inefficient mortising machine. It is, however, when we go in for further elaboration, when we introduce planing into the system of the joiner, that efficiency begins to run down rapidly.

The Planing Section.

The simplest way of effecting the introduction of the planer is to prolong the saw spindle still further, so that between the sawing and mortising ends of the spindle we can place a long cutter block. Whether that block is destined to be used as a hand feed planer, a panel planer, or an over-and-under planer depends on the design of the joiner. But, whichever it may be, the necessary structure is built up under it to fit it for the purpose, and this is done virtually as would be the case if the planing were to be done on a separate machine.

There are two very weak factors in this arrangement. The first is that when sawing and planing are done on one spindle the spindle must either run much too fast for the saw or much too slow for the planer. A compromise between the two renders both inefficient. If this point is overcome by a provision for varying the speed of the spindle to suit either the one or the other then the two cannot be worked simultaneously. The other bad feature is the inconvenience of the position of the planer, sandwiched in between the saw and the mortising attachment. Both from the point of view of working it and for adjusting the cutters this is bad. When the planing section is built on the hand-feed planer principle, as is most often the case in the more popular joiners of to-day, it is impossible for the man to stand in the most effective position for doing his work, which, as a rule, should be close to the spindle near the centre of one side of the table.

Four Side Planing.

When the planing section is arranged on the four-spindle principle the best that can be said of it is that it may do good work, but with great loss of time and inconvenience and at very moderate speeds. It is very difficult to fit such a planer with appliances for "tracking" the cutters on all its spindles, so anything in the way of high-speed planing is out of the question. It is also impossible to remove the under spindle for replacing the cutters, and so much time is lost.

Reverting to the simpler type of joiner, that with one spindle for sawing, planing and mortising, the difficulty of spindle speed is sometimes overcome by having two spindles, one for the sawing and the other for the planing and mortising sections. When such is the case the difficulty as to speeds is overcome, but it virtually means that there are two complete machines on the one bed plate, and it would be far better and more effective if they were totally independent so that they could be more conveniently placed and worked.

The Vertical Spindle.

The crowning feature of the general joiner is the addition of a vertical spindle for irregular and other mouldings. This projects upwards usually through the saw table, but in some designs through the planing table. In either case, although it may answer its purpose, it is purely an inconvenient makeshift, as neither of the tables is shaped ideally for the purpose, and the utilisation of the vertical spindle must throw out of use either the saw or the planer, as the case may be, for the time being. When joiners possess this vertical spindle it is usual to transfer the tenoning from the saw spindle to the vertical one. On this spindle dovetails also can be cut. This is a better arrangement, still it is not to be compared for efficiency with a proper tenoning machine.

The Functions Enumerated.

To catalogue the different work that can be done on a general joiner gives us a formidable list of capabilities. It is usually claimed for it, and perfectly truly, that, except for curve cutting, it will do any ordinary sawing which is required by the builder up to possibly 12 in. deep, also flatting and edging. It will cross-cut material up to perhaps 6 or 8 in. deep, and do mitre cutting. It will also cut any sort of groove or tongue and also do rebating, beading, and chamfering. In planing, it will either surface only, or both surface and thickness, or plane all four sides simultaneously, according to the design of the machine, up to possibly 12 by 4, and it will do all sorts of mouldings, straight and curvilinear. It will do single and double tenons, either rectangular or diagonal. It will bore holes of any diameter up to, say, 2 in., and mortise to any ordinary lengths up to 2 in. wide, and it will dovetail and do a variety of odd jobs. Thus the joiner is by far the most versatile of any wood-working machine, and it is ingenious to the last degree. It is its great versatility which makes so strong an appeal to the beginner, just as the many-bladed knife with a corkscrew, gimlet, punch, tweezers, scissors, and a file, inconveniently placed as they are, appeals to the schoolboy.

As a Pioneer Machine.

The joiner is not a bad machine for the novice to cut his mechanical wisdom teeth on, for when he has mastered all its adjustments and intricacies, he will be able to work perfectly easily virtually any other machine in a builder's shop. It is a good machine in an odd job shop where there is no more work than will keep one skilled machinist fully em-

ployed, because, although a single machinist would get through far more work by going from one machine to another with separate machines, there is a certain saving of space in employing a general joiner instead of separate machines.

There is not, however, much saving in effective space, because the individual machines can be so adjusted as to permit of every facility in the way of handling the material to the best advantage and ensuring that uninterrupted even passage of the planks from machine to machine without which an immense amount of time and labour is wasted. Thus the extra space required by the separate machines is actually a valuable asset. With a general joiner it is impossible to attain anything like the ideal in this respect because the material is presented to it on various sides, and there is, of necessity, a littering of material in different stages of completion around the machine, while waiting for further operations to be carried out.

For Estate Work.

The natural home of the general joiner is on an estate where the work is desultory and very mixed, where a five-barred gate has to be made to-day, some fencing to-morrow, and on another day a cowshed or a barn-door or some internal repairs for the house, where local timber is used, and a single all-round handy-man mechanic is employed. There its versatility is of great advantage, as it may also be in a very small builder's shop. In the latter, however, its slowness tells against it for it is impossible to hustle the general joiner. The number of operations that can be carried on simultaneously is naturally limited, and, were it not so, the operatives would often be in each other's way, and they could not work to advantage. It is quite possible, and it is usually the case, that most of the processes on a joiner can be performed individually in as short a time as would be required on the separate machines, but the day's output as a rule is much below the other method on account of the inconvenience in operating and the frequent readjustments.

For Temporary Work.

The general joiner had one great advantage over the separate machines when, for instance, it was a question of a temporary job, and it was undesirable to go to the expense of line shafting and other transmissions. In such a case a general joiner was easily fixed and, except for its countershaft, which was bolted to the floor, was self-contained. One foundation or, if the floor was good, no foundation, did for the lot, and the whole was driven by a belt to the countershaft from a portable engine or any other motive power that was handy.

I have used the past tense in the above paragraph although these conditions hold good to-day in cases where no electrical current is available for driving the machines. These occasions, however, are less frequent than they used to be owing to the increasing prevalence of electrical current for power purposes.

Electricity and The Joiner.

When current is available there is but little excuse for using a complicated combination machine of the joiner type for, although the countershaft of the joiner can be as easily driven by a motor as by an engine, we can with electricity do away with everything, or nearly everything in the way of countershafting, as explained in a previous article. The power consumption, too, will be much reduced for a given output. These advantages, coupled with that of facility in working and handling material, put the joiner out of court, in my opinion, when electrical current is available. We must bear in mind, too, that, although the price of a general joiner may be somewhat less than that of the several machines, the total cost of a joiner, plus the motive power, unless electricity is used, will be far more than that of the separate machines plus their motors.

The Separate Machines.

And what are the separate machines that would be required to do the work that the general joiner can do? In spite of the long catalogue of the joiner's capabilities, these machines are not many or formidable. They are:—(1) A saw bench with rising and falling table and boring and mortising attachment. (2) A vertical spindle moulder with tenoning and dovetailing attachment; and (3) one or other of the following planing machines, according to the design of the joiner. (*a*) A hand-feed planer, (*b*) a panel planer, (*c*) an over-and-under planer or (*d*) a 4-cutter planer. The above machines would do all that a general joiner can do and in precisely the same manner, but much more conveniently and as a rule more rapidly. They are not, however, in each case what I would recommend as substitutes for the joiner, because both the mortising and the tenoning as carried out on a general joiner are merely makeshifts and are not the best thing for builders' work. Thus, I should knock out the mortising apparatus attached to the saw bench and the tenoning apparatus from the vertical spindle machine and adopt a proper mortising machine and a tenoning machine according to approved lines, unless my output were very small.

A Useful Tool.

In spite of the many undoubted shortcomings of the general joiner, when compared with the separate machines, it has not been my wish to suggest that it is in any sense of the word a worthless machine. There are many extremely well made joiners in which the designs have been simplified as far as is humanly possible, and it is a notable fact, as already stated, that the joiners which meet with a sale to-day are nearly all of the simplest types, a combination of the saw, the hand feed planer, the slot mortiser, and the vertical spindle moulder. The complicated and fearsome structures that once were popular, some of which even embodied a band saw in their composition, are largely things of the past, and to-day it is generally recognised that to attempt to embody a four-cutter planer in a composite machine of the "joiner" class is a great mistake. The small builder who is bent on starting with a general joiner will undoubtedly find a well-made and properly designed machine of the simpler type a very valuable assistant to his hand labour, reducing his cost immensely and enabling him to do all sorts of operations that are essential to his work. And it will do them well though not as economically as would be the case with separate machines.

A Useful Experience.

By all means let such a man, if he wishes to put down a joiner for his early tentative steps do so. It will, if nothing else, be a useful experience for him as already explained. But let him look upon his joiner purely as a means to an end, a stepping stone to something better, and let him look forward to the day when he can discard it for something more efficient. That day will announce itself very clearly when he finds that his work has increased to such an extent that it irks him not to be able to carry on all or several of the operations simultaneously. Then let him take his courage in both hands and put down separate machines. He may possibly keep his general joiner as a standby, but he must not make the mistake of doubling his output by putting down a second joiner in the same shop. That would be fatal, for he would then merely have two relatively inefficient machines instead of one. A single plant of separate machines, with a man at each, would probably give him a bigger output for less labour and horse power than would three or four general joiners.

McGill University.

McGill University, Montreal (Department of Architecture), has been recognised as a school by the Royal Institute of British Architects. This recognition has only been granted to three other architectural schools outside Great Britain.

NORTHAMPTON MASTER BUILDERS' ASSOCIATION

The annual dinner of the Northampton Master Builders' Association was held at Northampton, on February 8. The President (Mr. Charles A. Sharman) was in the chair, and he was supported by Mr. H. E. Archer (Vice-President), and Mr. A. L. Airs (Secretary).

Replying to the toast of The Corporation, proposed by Mr. J. F. Stops, the Mayor of Northampton said they had all felt the urgent need for houses, and it had caused great uneasiness and concern, for no matter how they tried, or what expedients the Government had introduced, the houses had not been built as quickly as required. He was not uttering any complaints to the Association. His experience on the Housing Committee had been most depressing. When they thought they were getting on and had the shells of the houses up they found they could not finish them owing to the lack of plasterers. Whatever their politics he was sure all present hoped the efforts of the new Minister of Health to provide houses for the working classes at a reasonable price would be successful. They had had enough of £1,000 houses. He hoped those present would look at the question of housing not only from the point of view of their business, but also as a public duty resting on them to help to solve the problem of the provision of houses.

In proposing "Success to the Northampton Master Builders' Association," Mr. Hewitt said that as employers the builders had always welcomed dilution, but the Government had let them down. If the Government had seen them through there would undoubtedly have been dilution. As things were it was impossible for a bricklayer's labourer to be anything else but a labourer, owing to trade union law. He suggested they should build twenty houses to the acre in the form of rows. Why did they want cake when they could not get bread?

Other toasts were proposed by Mr. F. W. Smith, Councillor J. J. Martin and Mr. W. W. Webster.

EXPANSION OF BUILDING & CONSTRUCTION IN INDIA.

(From a Special Correspondent.)

Indian Topics.

The Burma Government Retrenchment Committee recommend, *inter alia*, a periodical examination of Civil Secretariat Procedure, and for the Chief Engineer of Public Works Department to place orders direct with firms in England, &c.

The Madras Fine Arts Society, Madras, will hold the Annual Exhibition, February 23–March 2, 1924.

The Government Glue Factory, Washermanpet, Madras, contemplate experiments by applying liquid glue in the laying of tarred macadam roads.

The Local Builder.—Well-known English builders and contractors, with branches in Bombay and Madras, have agencies for London sanitary appliances, English incandescent oil lamps, Scotch oils and paints, Sheffield steel, London leather belting, London drain-cleaning appliances, English wire ropes, hydraulic plant, &c.

Mechanical Appliances. — The Bombay Government has decided to extend the use of mechanical appliances with a view to increasing production and saving human and animal labour. Machinery must be adapted to local conditions.

Local Activity.—English electric lifts are being distributed from Calcutta, Bombay and Delhi. English stone-breakers are in request. English wire fencing, 40 in. and 48 in. high, at Delhi, Bombay, and Calcutta. Portable saw outfits.

Indian Projects.—Hyderabad has vast development schemes. The City Improvement Board is active with cleansing, clearing slums, sanitation, road widening, &c.

APPRENTICESHIP IN THE LONDON BUILDING TRADE.

Mr. Ernest Lesser (Chairman of the London Building Trades Apprenticeship Committee) writes:—

Sir,—Mr. Shaw, in his reply to Mr. Somerville, is substantially right, so far at any rate as the London area is concerned, in suggesting that the present serious shortage of apprentices in the building trade is not due to any restrictions imposed by the craft unions.

It is undoubtedly the fact that neither the relevant provisions of the present working rules agreement governing the London area, nor the rules of individual unions, can be held responsible for more than a small fraction of the shortage.

The working rules agreement now in force provides as follows: "No employer shall engage any additional apprentices to each trade whilst the number of his apprentices should exceed one-seventh of the number of journeymen then employed by him, with a maximum of eight in each trade, unless otherwise decided by the London Apprenticeship Committee, and all such apprentices shall be legally bound."

It is true that the imposition of a maximum limit for individual firms, irrespective of the number of journeymen employed, may operate, in the case of the large firms, to restrict unduly the number of apprentices in a particular craft. But, even making allowance for this, it is notorious that the majority of London master builders have not taken anything like the number of apprentices permitted by the agreement and the Trade Union rules.

The aggregate of London building trade apprentices should run into some thousands. Although it is difficult to obtain reliable figures, I am probably not far wrong in estimating the actual total number at a figure in the neighbourhood of one thousand.

I am, of course, now dealing only with apprentices, *i.e.*, lads, whether strictly indentured or not, who are receiving a systematic and progressive course of training spread over a term of years.

As regards the real causes of the present grave shortage of apprentices, your columns have of late had several letters on the subject, and Mr. Bennett's, in particular, was a very valuable contribution. I hesitate, therefore, to encroach on your space in order to go over the ground again in any detail. It seems to me that the main operative causes may be briefly summarised as follows:—

(1) The facility with which the London employer has until recently been able to recruit trained journeymen from the provinces. As a result of the tendency for provincial rates of pay to approximate more and more to those of London the constant drift of provincial craftsmen to London has now largely ceased, and many master builders are now for the first time faced with the necessity of finding skilled craftsmen in some other and less easy way.

(2) The shortening of the working day, coupled with a speeding up of work generally, tends to make both masters and foremen grudge the time required for the instruction of lads. And they are naturally still more reluctant to allow the apprentice time off to attend technical classes.

(3) Owing to the fluctuating state of the trade the smaller builder hesitates to indenture lads, with the attendant liabilities, for fear of not being able to perform his covenants adequately.

(4) Many employers are hostile to the whole system of apprenticeship and the responsibilities involved. They prefer to be able to take on and dismiss lads as and when they please.

(5) It is more difficult since the war to induce lads to become indentured, partly because of the length of the term and the resulting restraint on their freedom of movement, and partly because they can now earn in an unskilled or semi-skilled trade almost as good wages—and that at a much earlier date—as in a skilled trade. The remedy for this would appear to lie in a shortening of the term of apprenticeship and the reduction of the rates paid to juvenile unskilled labour.

(6) The present curriculum of the average elementary school is calculated to give a bias in favour of clerical work. In so far as it may tend to prepare a lad for entering the building trade it would be only for the woodworking branches.

(7) The seasonal and fluctuating nature of much of the work and the general lack of amenities naturally operate to deter many intelligent lads—not to speak of their parents.

ESTIMATING.

We have received the following from Mr. T. Sumner Smith:—

Sir,—Judging by "W. S.'s" letter in your issue of the 8th inst., it would seem that he had been placed at a disadvantage in not having recourse to my tables when reading my paper. In arriving at the cost of a yard cube of concrete he proceeds, up to a point, precisely in the same way as outlined in my paper—by the ascertainment of the weight of the materials for a given volume. From that point we part company.

He apparently takes his arbitrary mix, namely, 4 parts broken granite, 2 parts sand, and 1 part cement, then proceeds to ascertain what the sum of these parts (4+2+1=7) by volume in cub. ft. after mixing with water will produce in volume of finished concrete, and he says 7 cub. ft. of materials plus water used in mixing will produce 4 2-3 cub. ft. This, he says, will vary with the different materials used, which, I presume, he means will vary according to the size and grading of the aggregate, and the fineness or otherwise of the sand.

It will be obvious, seeing that his 7 cub. ft. of materials plus water plus entrained air produce only 4 2-3 cub. ft. of finished concrete, that the sand goes to fill the voids or spaces in the 4 cub. ft. of his aggregate, and the cement goes to fill the voids or spaces in the sand, which, together with the water used in the mix and the entrained air give 2-3 cub. ft. in excess of the aggregate. Whatever be the amount of water he used in the mix, and whether this combined chemically with the cement or remained a separate entity, and whatever were the spaces of the entrained air, we may, as he says it was thoroughly rammed, conclude that he obtained a compact mass. We derive from this the quantities of his solid materials used in a cub. yard of finished concrete. Thus, for aggregate, by dividing 27 by 4 2-3 and multiplying the quotient by 4; for sand, by dividing 27 by 4 2-3 and multiplying the quotient by 2; and for cement, by dividing 27 by 4 2-3. This gives the following results:—

Aggregate	..	23.14	cub. ft. per cub. yd.
Sand	..	11.57	,, ,,
Cement	..	5.78	,, ,,
Total	..	40.49	

We will assume his weights of materials by volume to be as follows:—

Aggregate per cub. ft.	..	85 lbs.
Sand ,,	..	95 lbs.
Cement ,,	..	90 lbs.

And these, multiplied by the number of cub. ft. respectively in each case that it takes to make a cub. yd. of concrete, will give the weight of each kind of material for a finished cub. yard of concrete, and then these priced at the rate value of each will give the cost of the materials, thus:—

Aggregate $85 \times 23.14 = 17.5$ cwts., at .. £
Sand, $95 \times 11.57 = 9.8$ cwts., at ..
(Or if sand is bought per yard cube, then
$\frac{11.57}{27} = .436$ cub. yards at) ..
Cement, $90 \times 5.78 = 4.64$ cwts., at ..

Cost of materials per cub. yard .. £

I have taken this example of "W. S.," and dealt with it at length with the hope that it may be of service to him as well as to others, and I think "W. S." will agree that it is a much simpler, more accurate, more reliable, and a far better method of arriving at the cost than that given by him; and, further, that it is not necessary to evolve a formula in cwts. of materials, as the same may be obtained by direct calculation as I have shown.

"W. S." would seem to have a grievance against me because after having read extracts of my paper, it had not added to his knowledge. However, be that as it may, I suggest that if he does not prefer to obtain the quantities of materials by the scientific method I enumerated, based upon the ascertainment of the density of materials, he should use in future my formula for arriving at the approximate quantities of materials it takes to make a cub. yard of cement concrete, when ordinary average crushed aggregate is used and the cement is expressed as one part. Taking his proportions 4 : 2 : 1, he could "cut out" his tests, which result in waste, avoid his cumbersome calculations, and yet obtain practically the same result within 10 seconds, thus:—

Aggregate	..	..	23.88
Sand	..	..	11.94
Cement	..	..	5.97
Total	..	..	41.79

And then obtain the cost in the manner I have shown.

I am grateful to "W. S." for his example, as it affords a comparison with my formula for approximate quantities.

With your permission, Sir, I will now state this rule, as the same was omitted in your extracts.

The simplest rule for ascertaining the approximate quantities of materials for a cubic yard of cement concrete is obtained by dividing the constant 41.8 by the sum of the parts of all the ingredients (when the cement is expressed as one part) and the quotient will be the number of cubic feet of cement for one cubic yard of concrete; for sand, multiply the quotient by the number of parts of sand, which will give the number of cubic feet of sand for one cubic yard of concrete, and for aggregate multiply the quotient by the number of parts of the aggregate, which will give the number of cubic feet of aggregate for one cubic yard of concrete.

Let C = one part cement.
Let S = number of parts of sand.
Let A = number of parts of aggregate.
And taking "W. S.'s" proportions, 4 : 2 : 1, then,

$$\frac{41.8}{C+S+A} = \frac{41.8}{7} = 5.97 \text{ cement.}$$

$C \times S = 5.97 \times 2 = 11.94$ sand.
$C \times Ag. = 5.97 \times 4 = 23.88$ aggregate.

In using this rule, about 5 per cent. should be added to all the materials when the coarse material is screened to uniform size, as it contains less solid matter in a given volume than an average size. When the coarse material contains a large variety of sizes, as to be quite dense, about 5 per cent. may be deducted from all the quantities.

This rule gives results for all practical purposes to within 5 per cent. either way.

But if we desire, among other things, to find the proper proportions of mix for concrete in relation to its strength, costs and compactness, then the only way is by the ascertainment of the density of the materials.

With reference to "W. S.'s" point regarding payment for water at a rate fixed by the amount of the contract and not by the gallon, this is only another way (a rough-and-ready way) of estimating the amount likely to be consumed and whose price has been based upon its measure by the gallon. One might just as well argue that because the Scotchman buys his "food" by the bottle, it has no relation to measure.

Builders' Estates.

Mr. Robert Price, Abergavenny, builder, left estate of gross £8,732, net personalty £4,989.

Mr. Alfred Davis, of Hill Crest, Burnopfield, Durham, builder (net personalty £2,762), £6,481.

Mr. Frederick Stanley Webb, of Broad-street, Wells, Somerset, builder (net personalty £4,293), £6,438.

THE ROMANCE OF BUILDING THROUGHOUT THE AGES.—III.

IN his third lecture* to the junior members of the Amalgamated Society of Woodworkers, at Liverpool, Mr. George W. Thompson dealt with Greece from the eighth century B.C. to the second century B.C.

Greece, he said, was surrounded on three sides by the sea, and there were many natural

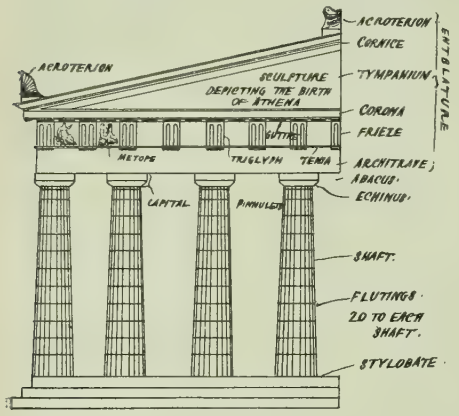


FIG. 1.

harbours. Commerce was, therefore, capable of being easily developed.

The principal building material in Greece was marble, the most monumental stone in existence, and one which enabled purity of line and refined detail to be secured. Crude bricks were also used for building; these were often coated with

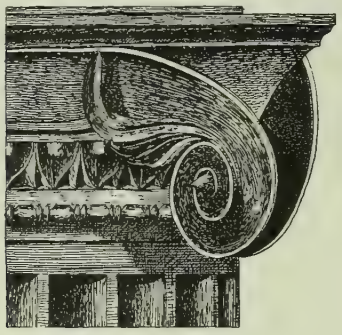

FIG. 2.

a cement made of marble dust and lime. The country contained rich deposits of iron, copper, and silver.

Hot suns and heavy rains prevailed in Greece, and these factors might account for the porticoes which formed a feature of the temples. The climate was not rigorous, as in the north, nor

FIG. 4.

relaxing as in the east and certain southern countries, and that might, in a high degree, be responsible for the unique qualities of ancient Greeks.

The Greek religion was largely a worship of natural phenomena, the gods being personifications of nature. It was of interest to note that both men and women officiated in the temples.

The national games of the Greeks and their religious festivals united them in reverence for their religion, and gave them that love for music, the drama and the fine arts, and that participation in manly sports and contests, for which they were so distinguished. National joy, caused by the defeats of the Persians, was largely responsible for the fact that all the

FIG. 3.

important temples now found in Greece were built in the fifty years which succeeded the battle of Salamis. The rule of Pericles (444–429 B.C.), known as the "Golden Age," marked the climax of Athenian prosperity.

The Greeks built in the trabeated style (*trabs*=beam); that was to say, their buildings looked at from a mechanic's viewpoint, consisted of arrangements of columns supporting beams. The arcuated style, a combination of beam and arch, was practised later by the Romans. Mortar was not used, the beds of adjacent blocks of marble being made to fit perfectly and in close contact. The blocks were connected by means of metal cramps. Greek buildings possessed the qualities of harmony, simplicity, and unity because of the accuracy of their proportions, their truthful and undisguised construction, and the employment of uniform constructive principles. The long lines in pediments, columns and architraves, which, if built straight in reality, would appear to bulge or droop in the middle of their length, were formed with convex lines. Colour and gilding were used by Greeks, and some of the remains still showed traces of colour.

The Greeks developed the orders of architecture, the Doric, the Ionic, and the Corinthian being used by them. An "order" consisted of the column, including base and capital, and the part supported called the entablature. The entablature was composed of architrave, or lowest member; the frieze, or middle member; and the cornice, or uppermost member. The sequence of the "orders" was well expressed by Thomson in the following lines:—

"First, unadorned,
And nobly plain, the manly Doric rose;
The Ionic, then, with decent matron grace,
Her airy pillar heaved; luxuriant last,
The rich Corinthian spread her wanton wreath."

The Doric Order was the oldest, plainest, and most sturdy. It was thought to be derived from wooden built structures, but many authorities rejected this theory. The column had no base, and a circular shaft diminishing towards the top, with about twenty shallow flutes divided by sharp arrises. The shaft was given an outward curvature, called "entasis," which corrected the hollow appearance of straight-sided columns. The capital was composed of abacus, echinus, and annulets. The architrave had one face, and was separated from the frieze by a flat moulding called tenia, and underneath this at intervals was a narrow band called the regula, having six guttae. The frieze had triglyphs ornamented with channels and metopes, or square spaces between them, which were often filled with sculpture. The cornice had an upper part of cymatium and bird's beak mouldings beneath which was the vertical face called the

* The first of this series of lectures was given in our issue for February 1 and the second on February 15.

corona. The soffit of the cornice had flat projecting blocks called mutules. The Parthenon was the finest Doric example.

The Ionic order was remarkable for the scroll or volute capital, which might be derived from the spiral as found in the ram's horn, snail or other shell. The shafts of columns were fluted, but the flutes were separated by fillets and not by arrises. The base was moulded with torus and scotia. The capital had a pair of volutes separated by a cushion, which was sometimes plain and sometimes echinus carved with egg and dart, and a bead under. The Erechtheum (420–393 B.C.) was a fine example of the Ionic order.

The Corinthian Order was more ornate than Ionic and only little used by the Greeks. The base and shaft of the column resembled Ionic. The capital was of acanthus leaves, from which sprang volutes supporting angles of abacus. Small central volutes supported the foliated central ornament. The abacus was curved in plan on each face. The Temple of Jupiter at Athens was a good example of Grecian Corinthian.

The Grecian Doric order possessed no base. An order consisted of the column and entablature, which when subdivided into their component parts gave cornice, pediment, frieze, and architrave; these forming the entablature. The column was divided into capital, shaft, and base. When there was no base the shaft rested upon the stylobate. The column of the Ionic order always rested upon a base.

The origin of the Corinthian capital was not known with certainty, but a legend told that Callimachus, of Corinth, a clever worker in bronze, was its author. It was said that he was impressed by the beauty and elegance of the leaves of an acanthus plant which he observed growing around a vase or a basket, and seizing upon the idea he made columns for the Corinthians with capitals in imitation of the growing plant and vase.

The contours of Greek buildings were never composed of arcs of circles, but of arcs of ellipses, parabolas, and hyperbolas. Refinement and delicacy were their chief characteristics, achieved by an almost continuous sunshine, a clear atmosphere, and the hard marble in which they were formed.

Fig. 1 is a half elevation of the portico of the Parthenon (Doric order); Fig. 2 is a column capital of the Ionic order; Fig. 3 is a half-elevation of a Corinthian capital; Fig. 4 is an example of the Greek acanthus leaf; Figs. 5 to 11 are examples of Greek ornament—Fig. 5, dentil; Fig. 6, pearl; Fig 7, fillet bead; Fig. 8, fillet; Fig. 9, leaf and dart; Fig. 10, fret; Fig. 11, key; Fig. 12 shows Greek mouldings.

RATING.

Mr. C. Dalgliesh, F.S.I., recently gave the first of three lectures on "Rating" at the College of Estate Management.

The lecturer dealt with the part of the subject with which surveyors were more nearly concerned—the ascertainment of gross and rateable values. He pointed out that, with one unimportant exception, all rateable values were the ascertainment of the reasonable expectation of letting value, and that a surveyor in making a valuation for rating purposes was expressing a trained expert opinion based on evidence. It was the skill, knowledge and experience of the surveyor which enabled him to decide what was material evidence, and what deductions he should make from it.

Mr. Dalgliesh then subjected the statutory definitions of value to critical examination, pointing out that it was basically important to bear in mind that, amongst the probable tenants for a property, must be included the tenant himself.

RATES OF WAGES IN THE BUILDING TRADE.

The following are the rates of wages in the building trade in England and Wales. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur:—

	Masons.	Bricklayers.	C'p'ters. Joiners.	Plasterers.	Slaters.	Plumbers.	Painters.	Labourers.
Aberdare	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Accrington	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½

(For rates of wages in the Building Trade in Scotland, see page 362).

CONTRACTS, COMPETITIONS, &c.

For some contracts still open, but not included in this List, see previous issues. Those with an asterisk are advertised in this number. Certain conditions beyond those given in the following information are imposed in some cases, such as that advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in; the name and address at the end is the person from whom or place where quantities, forms of tender, &c., may be obtained.

BUILDING AND PAINTING.

MARCH 1.—**Abersychan.**—HOUSES, &C.—For erecting for the Abersychan U.D.C., 54 dwelling-houses on the Manor-road site, and for construction of necessary roads and sewers. Mr. W. T. Springall, Co-operative Wholesale Society, Ltd., St. Mary-street, Cardiff.

MARCH 1.—**Builth.**—BRIDGE.—For widening and strengthening six-arch masonry bridge and approaches, for the Breconshire and Radnorshire County Councils. Mr. W. L. Harpur, County Surveyor, County Offices, Brecon. Deposit £2 2s.

MARCH 1.—**Cardiff.**—MORTUARY.—For erection of a mortuary at Ely Lodge Institution, for the Board of Guardians. Messrs. Willmott & Smith, architects, 4, Park-place, Cardiff. Deposit £2 2s.

MARCH 1.—**Denbigh.**—ALTERATIONS.—For alterations at Green Congregational Church, near Denbigh. Specifications at Voel Gaer, Fron, Denbigh.

MARCH 1.—**Llanharan (Glam).**—ALTERATIONS.—For alterations to the Llanharan Constitutional Club. Secretary at the Club.

MARCH 1.—**Lostwithiel.**—COTTAGES.—For the erection of four pairs of cottages, for the Lostwithiel Building Syndicate. Mr. E. Brown, Secretary, Pentillie, Lostwithiel.

MARCH 1.—**Romsey.**—HOUSE.—For building small house, at Whitenap, near Romsey. Mr. George Symes, Lond View, Winchester-road, Romsey.

MARCH 3—**Biggleswade.**—PUBLIC CONVENIENCE.—For erection of a semi-underground public convenience for U.D.C. Mr. H. Chaundler, Clerk to the Council, Biggleswade. Deposit £2 2s.

MARCH 3.—**Carlisle.**—DEMOLITIONS.—For the pulling down and removing of the whole of block of property situate in Rickergate and Drovers-lane for the T.C. Mr. Henry C. Marks, City Engineer, 18, Fisher-street, Carlisle.

MARCH 3.—**Eastbourne.**—CHALET &C.—For the erection of a tea chalet and shelter at Holywell, for the C.B. Borough Engineer's Office, Town Hall, Eastbourne. Deposit £1 1s.

MARCH 3.—**Edinburgh.**—WASHHOUSE.—For the erection of public washhouses, Abbeymount, for the T.C. Mr. James A. Williamson, City Architect, City Chambers, Edinburgh.

MARCH 3.—**Erpingham.**—COTTAGES.—Erection of cottages in the following parishes:—Knapton 6, Northrepps 6, Gimingham 4, East Runton 2, for the R.D.C. Mr. A. R. Tuddenham, St. Peter's-road, Sheringham.

MARCH 3.—**Gateshead.**—PAINTING.—For painting works at the Poor Law Institution, for the Board of Guardians. Mr. George Craighill, Clerk, Offices, Gateshead.

MARCH 3.—**Hendon.**—HOUSES.—Erection of 44 houses and 8 flats at Kingsbury-road, West Hendon, for the U.D.C. Mr. A. O. Knight, A.M.I.C.E., Engineer to the Council, Town Hall, Hendon, N.W.4. Deposit £3 3s.

MARCH 3.—**London, S.W.1.**—DECORATIONS AND REPAIRS.—Painting internal woodwork, papering walls, whitening ceilings, &c., and repairs to four cottages, situated at the Council's western pumping station, Grosvenor-road, Pimlico, S.W.1, for the L.C.C. Chief Engineer, the Old County Hall, Spring Gardens, S.W.1. Deposit £1.

MARCH 3.—**Newcastle-on-Tyne.**—For Contract No. 2, in connection with banqueting hall and additional bedroom, Station Hotel, being all trades except steelwork, for the L. & N.E. Railway. Mr. Stephen Wilkinson, architect, North-Eastern Area, Newcastle-on-Tyne.

MARCH 3.—**Plymouth.**—Erection of 27 houses, containing 54 flats, at Prince Rock. Form of tender, copy of bills of quantities, block plan, may be obtained, and conditions of contract, plans, and specification seen at the office of the undersigned, on and after 19th inst. Tenders sealed and endorsed "Tenders for erection of flats, Prince Rock," together with all documents, &c., be delivered to Town Clerk, Municipal Offices, Plymouth, not later than 10 a.m. on March 3 next. A deposit of £2 2s. will be required to be refunded on receipt of bona fide tender and return of plan and all documents. The Council do not bind themselves to accept the lowest, or any, tender. Mr. J. Wibberley, Borough Engineer and Surveyor, Municipal Offices, Plymouth.

MARCH 3.—**St. Andrews.**—HOUSES.—Erection of 50 houses at St. Mary's-street site, for the T.C. Mr. Wm. Watson, Burgh Surveyor, Town Hall, St. Andrews. Deposit £1 1s.

MARCH 3.—**Sheffield.**—SUB-STATIONS.—Erection of (*a*) transformer sub-station in Greystones-road, and (*b*) transformer sub-station in Sheldon-road, for the T.C. Mr. S. E. Fedden, General Manager, Commercial-street, Sheffield. Deposit £1 1s. each contract.

MARCH 3.—**Truro.**—ALTERATIONS.—For proposed additions and alterations to Truro Wesleyan College Mr. A. J. Cornelius, architect, Truro.

MARCH 3.—**West Ham.**—PAINTING, &C.—For repairing and painting the exteriors of various schools for County Borough of West Ham Education Committee. Mr. John H. Jacques, Lic.R.I.B.A., architect, 61, West Ham-lane, Stratford, E.15. Deposit £1.

MARCH 4.—**Aldershot.**—HOUSES.—Erection of eight blocks of four houses, thirty-two in all, at Aldershot Park Housing Scheme No. 2, for the Borough of Aldershot. Borough Surveyor's Office, Municipal Buildings, Aldershot. Deposit £5.

MARCH 4.—**Barking.**—HOUSES.—Erection of about 59 houses on the Eastbury Estate, Ripple-road, Barking, for the Barking U.D.C. Council's Architect, Mr. C. J. Dawson, F.R.I.B.A., Clock House Chambers, East-street, Barking. Deposit £5.

MARCH 4.—**Batley.**—SCHOOL.—For erection of a Primary Sunday School at Purlwell Wesleyan Chapel. Messrs. Firth, Son & Blackburn, architects, 22, Wellington-road, Dewsbury.

PROPOSED NEW BUILDINGS & OTHER WORKS.*

In these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building owners taking the responsibility of commencing work before plans are finally approved by the local authorities, "proposed" works at the time of publication have been actually commenced. Abbreviations:—T.C. for Town Council; U.D.C. for Urban District Council; R.D.C for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; L.C.C. for London County Council; B.C for Borough Council; and P.C. for Parish Council.

ACCRINGTON.—The Borough Surveyor has been instructed to prepare plans for a structure giving shelter and providing separate accommodation for bowlers and tennis players, with lavatory, wash basins, and sanitary convenience, and submit estimates of the cost.

ASHTON-UNDER-LYNE.—It is reported that during the coming summer operations would be commenced for the erection of a nurses' home for the Ashton District Infirmary.—The Managers of Christ Church School, Littlemoss, are intending to enlarge the school premises for the additional accommodation of 80 scholars.

ALTRINCHAM.—The Managers of the Bradbury Central School are applying for permission to erect an extension with provision for 120 scholars.

BACUP.—The T.C. is applying to the M.H. for the erection of a further 50 houses under the subsidy scheme.

BALLYMONEY.—The U.D.C. has decided to proceed at once with the scheme for the erection of 22 cottages.

BARNES.—Plans passed by U.D.C.: Shop and residence, 349, Upper Richmond-road, by Mr. Ed. Monson; three shops and residences, Upper Richmond-road, by Mr. Geo. Heath; house, Sheen Common-drive, by Mr. G. A. Gale; house, Christ Church-road, by Dix (Decorators), Ltd.; four houses, Lower Richmond-road, by Mr. G. W. F. Bates; new cold store and tun room, Mortlake Brewery, by Messrs. Watney, Combe, Reid & Co., Ltd.; 14 houses, "Clare Lawn" Estate, Sheen-lane, by Messrs. Rosevears.

BARROWFORD.—The Council has approved plans of dwelling-houses in Carr Hall-road, for Mr. D. Tattersall, Mr. F. Dyson, and Mr. R. Jacques, and for a bungalow in Colne-lane, for Mr. W. Blamire.

BATTLE.—Plan passed by R.D.C.: Additions to Royal Oak Hotel, Whatlington.

BELFAST.—Plans passed: Two shops and stores, Mill-street, for Mr. S. Gibson, architect, Mr. D. W. Boyd; eight villas, Salisbury-avenue, for Mr. D. McCune, architects, Messrs. Young & Mackenzie; four villas, Bawnmore-road, for Mr. Francis Curley, architect, Mr. C. McAlister; villa on Antrim-road, for Mr. S. R. Boyd, architect Mr. F. W. Shaw; shop and house, Cilvio-street, for Mr. T. E. Carlisle, architect Mr. Hugh Gault; villa, Balmoral-avenue, for Mr. H. J. Titterington, architects, Messrs. Tulloch & Fitzsimons; two houses, Luxor-gardens, for Mr. Thomas Dalzell.

BEXHILL.—Plans passed by T.C.: House, Cooden drive, Mr. G. E. Clare, for Mr. H. J. Stanbury; house, Terminus-avenue, Mr. A. H. Burton, for Mr. J. S. Malings; house, Richmond-avenue, Mr. A. E. Barker, for himself; house, Clavering-walk, Mr. E. H. Gandy, for Mrs. Williams; three cottages, Clinch Green, for Major Lomer; house, garage and workshop, Ninfield-road, Mr. D. B. Sceats, for Mr. F. Metcalfe; pair of semi-detached houses, Knebworth-road, Mr. D. B. Sceats, for Messrs. Sceats & Bates; house, Cranston-avenue, Mr. J. E. Maynard, for Mr. W. S. Bemi; four cottages and shop, St. James'-road, Messrs. Wall, Callow & Callow, for Mr. S. Carey; block of three flats, West-parade, Messrs. Wall, Callow & Callow, for Mr. G. Ravenshear; houses in Cooden-drive, Mr. A. C. S. Wheeler, for Messrs. Miroads, Ltd.; converting out-buildings into a bungalow at "The Thorne," Ninfield-road, Mr. J. H. Lye, for Mr. Gibbons.

BILLINGE.—Applications for a subsidy to assist in the erection of 15 houses have been granted. Plans of houses to be erected by Miss E. Milling, of two houses by Messrs. R. & F. Milling in Upholland-road, of four houses in Moss-road by Mr. W. Winstanley, of two houses in Greenslate-road by Messrs. Gaskell & Co., and of four in Orrell-road by Messrs. Gaskell Bros., were passed.

BIRKENHEAD.—The T.C. has agreed to the erection of 453 houses on the Tranmere Hall Estate, at a cost of about £300,000.

BISHOPS STORTFORD.—Plans passed by U.D.C.: Bungalow, Elm-road, for Miss Hills; two cottages, Manor-road, for Messrs. Cannon & Sons; four cottages, Stansted-road, for Mr. E. Markwell; cottage, Hadham-road, for Major Neilson.

BLACKBURN.—The Library Committee has approved a plan for converting the lending library into the open-access system. The scheme includes the making of a new entrance in Richmond-terrace, and the provision of shelving for about 24,000 volumes.

BLACKPOOL.—The Blackpool Corporation has made application for permission to introduce a hostel for destitute women and girls. The Plans Committee approved plans for the building of about 150 houses.

BLAYDON.—The U.D.C. has approved the following plans: 20 bungalows at Rowlands Gill, for Mr. Henry Bowers; 7 houses at High Spen, for Mr. G. C. Johnson; 10 semi-detached houses on the Burnopfield Co-operative Society's land at Highfield, Rowlands Gill, and for a number of semi-detached houses at the Axwell Estate, for Messrs. Mauchlen & Weightman, Newcastle. ——The Council decided to erect 25 houses at Chopwell, for private purchasers, conditionally.

BOURNEMOUTH.—The T.C. has applied to the M.H. for a loan of £6,000 for extensions to the Bournemouth Police Station.——Tenders are being invited for a beach superintendent's office, shelters, and bungalows. ——New concrete bridges are to replace the present rustic bridges at Boscombe and Alum Chines, and the M.H. has been asked to sanction the expenditure as also an expenditure of £2,326 for the purchase of land to erect public baths on the Northwood Estate. ——The T.C. is being recommended to provide a branch library at Southbourne.——The T.C. has had under consideration the erection of another 100 houses under the Housing Act of 1923, and a scheme is to be drawn up by the Housing Committee.

BOWLAND.—The Education Sub-Committee has recommended the West Riding authority to extend the accommodation at Grindleton-lane End School.—— The Licensing Justices have approved plans of proposed alterations to the "New Inn," Gisburne, submitted by the Blackburn Brewery Co., Ltd.

BRADFORD.—The Headquarters of the Bradford Permanent Benefit Building Society in Town Hall-square are to be reconstructed. Plans have been prepared, and tenders are about to be invited by the architects, Messrs. James Young & Co., Market-street, Bradford.

BRIDGEND.—The Bridgend U.D.C. has passed plans as follows: Two houses in Hernstone-lane, for Messrs. Romans & Barber; two houses in Grove-road, for Messrs. Howells & Durant; two houses in Grove-road, for Mr. J. W. Robbins; bungalow at Tondu-road, near Cwm Bridge, for Mr. R. P. Williams; bungalow in Jenkins-street, for Mr. Bruce Randall; three houses in Jenkins-street, for Messrs. Isaac, Fitzgerald & Williams; house at Brynteg, for Messrs. Williams & Thomas; house in Jenkins-street, for Mr. Fred Gronow; twenty-four houses in Grove-road, for Mr. P. Gaylord.

BRIGHTON.—Plans passed by T.C.: Two self-contained flats, Down-terrace, W. J. Burstow, for T. J. Braybon; terrace house, Princes-crescent, H. W. Sanders, for J. Levick; alterations, Railway Hotel, Surrey-street, A. B. Packham for Tamplin & Sons' Brewery, Brighton, Ltd.; An inquiry has been held by the M.H. in regard to the Provisional Order which the Council is applying for to enable the town to acquire compulsorily certain property required for widening Western-road and West-street, and creating a square between Surrey-street and Queen's-road; also for the creation of an open market between Baker-street and Francis-street. The estimated cost of the scheme is between £280,000 and £300,000.

BURY.—The Sewering, Paving and Streets Committee have approved plans for 42 houses.——It is proposed that a new mortuary be erected at the Fire Brigade Station.——The Baths Committee has recommended the T.C. to borrow £10,985 for open-air baths adjoining Clarence reservoir.

CARLISLE.—Plans approved: Mr. J. H. Martindale, Architect, on behalf of the Building Committee, Crosby-on-Eden, memorial hall for a public hall at Crosby; by Mr. H. H. Hodgkinson, bungalow at Wheelbarrow Hall-road; two houses on the same road; by Mr. H. Irving Graham, Silloth, for a cottage at Harker.

CHESTER.—Plans passed by T.C.: Shop and warehouse, for Dickson's Seeds, Ltd.; four houses, Lache-lane, for Brown & Co. (Chester), Ltd.

CHESTERFIELD.—The E.C.'s estimated expenditure for the coming financial year includes for two new schools in the Baden Powell-road district. The C.C. (Derbyshire) propose to erect a new bridge of reinforced concrete over the River Derwent, between Sheffield and Bakewell. The bridge is to be 40 ft. wide, and is estimated to cost £24,000.

CLYDEBANK.—Plans have been approved by the Dean of Guild Court for the erection by Clydebank Co-operative Society of a large creamery on a site at Chalmers-street.

COATBRIDGE.—The Dean of Guild Court has granted lining for extensions to R. B. Tennent's foundry, Whifflet, to cost £3,000.

DARLINGTON.—The T.C. have received intimation from the M.H. that certificates will be granted to the Coropration for another 150 houses.——The Streets Committee have approved the lay-out plan for the "Dog and Gun" estate, Neasham-road.

DRIGLINGTON.—Plans passed:—Two houses at Adwalton, for Mr. George Johnson.

DUBLIN.—Plans passed:—Gardiner-street, Lower, 71–73, rebuilding hotel, Mr. F. A. Moran; Wellington Quay, 42–43, and Temple Bar, 17, new premises, Messrs. Clarke & Costello.

EARSDON.—The Surveyor of the U.D.C. stated that an estate plan had been submitted, showing 336 houses proposed to be erected on the Park House Estate.

HESTON AND ISLEWORTH.—Plans passed by U.D.C.: P. Chase Gardener & Co., house, Hounslow-gardens; Roper, Son & Chapman, 21 houses, Sutton-road and Heston-road; R. Emmett & Son, house, Grove-road; Dodge & Reid, bungalow, Jersey-road; S. L. M. Avery, five houses, New Heston-road and Smoky-lane; J. R. Pettifer, house, Wood-lane; R. Emmett & Son, garage, 100, Hibernia-road; Glenister Woodger, 16 houses, Pear Tree Estate; Building Enterprises, Ltd., 16 houses, Jersey-road; Silwood Construction Co., Ltd., six houses, Granville-avenue; P. Chase Gardener & Co., four houses, Tiverton-road, and two houses, Bulstrode-road.

EDINBURGH.—The Dean of Guild Court, at its last meeting, granted warrant to the Edinburgh Hippodrome, Ltd., to erect a picture house at the Leith-walk corner of Annandale-street. Forty-three cases were before the Court, 27 of which were full petitions, and 21 were granted. Included in this number was a warrant to James Roy and others to erect 61 houses at Clark-avenue, under Councillor Baxter's housing scheme, and will cost the purchaser under £500. Among the other warrants granted were the following:—A. W. Bell, villa at Grant-avenue, Colinton; the Corporation, bench walls at Greyfriars' Churchyard; the Corporation, lairages for imported cattle at the Cattle Market, Gorgie; Colville & Kennedy and others, three-story tenement at 20, Mayfield-road (the tenement will contain six houses); Sir Robert Maule, four-story building, to be used as stores, &c., at Caledonian-crescent; Mrs. M. I. Reid, house and offices at Belmont Estate, north-west of Murrayfield-road; Thomas Scoon, two semi-detached villas at Dovecote-road, Corstorphine; Gardners' Hall Trustees, house at 29, Gardners'-crescent, Elder & Watson, villa at Afton-terrace; David Waddell, shops and dwelling-houses at Spylaw-street, Colinton.

EDMONTON.—Sanction of the M.H. has been received by the Board of Guardians for the expenditure of not more than £5,230 upon alterations and additions to the laundry at Edmonton House.

FARSLEY.—Plans passed:—Sanitary conveniences and bathroom in Andrew-street, for Mr. Shuttleworth; sanitary conveniences and bathroom in Land-street, for Mr. E. Parkinson.

FLEETWOOD.—Plans passed by U.D.C.: Three houses in Darbishire-road, for Mr R. Eaves; six houses, Park-avenue, for Mr. R. Lancaster; two houses, Fleetwood-road, for Mr. E. F. Logan; house and shop, Shakespeare-road, for Mr. H. F. Elliott.

FLINT.—House, Chester-road, for Mr. J. Williams.

FRODINGHAM.—The L. & N.E. R. Co. are seeking powers in a Bill now before Parliament to carry out new works and extensions to present tracks at an estimated cost of £188,726. This expenditure includes for the construction of a new passenger station.

GELLYGAER.—The U.D.C. has decided to erect 50 houses at Bargoed, and will shortly invite tenders for the work.——The Council has agreed to a proposal of a Building Corporation to erect 100 houses at Penallta.

GLAMORGAN.—The Pontypridd B.G. has received Ministry sanction to its proposal to convert the Llynipia branch institution into a hospital or infirmary.—— The Cardiff R.D.C. is to carry out private street works at Tongwynlais.

GLASGOW.—Two important schemes for the provision of dwelling-houses in the city received the consent of Dean of Guild Court at its last sitting. One was the Corporation project at Crossmyloof. The Corporation will build three tenements comprising 276 houses of three and four apartments at an estimated cost of £123,831. The other venture marks the first scheme to be promoted in Glasgow under the conditions of subsidy to private builders. The Corporation approved plans submitted to them by Mr. James Downs, builder, Crow-road, for the erection of 45 houses at Jordanhill. The principal linings granted were:—John Chisholm, 34, Ancaster-drive, villa at Langlands-road, Newlands; James W. G. Oswald, of Scotstoun, lane between York-avenue and Kent-avenue, Jordanhill; Corporation Parks Department, bandstand at Alexandra Park; Kirklee Tennis Club, tennis pavilion and fencing at corner of Gower street and Kelburne-street, North Kelvinside; James Downs, 620, Crow-road, Jordanhill, 100 terrace houses and form lanes and sewers at Munro-road, Austen-road, and Chamberlain-road, Jordanhill; John H. Campbell, 135, Buchanan-street, two dwelling-houses, garages, &c., at Percy-street, Maryhill; Corporation Housing Department, streets and sewers at Possilpark, with a view to the extension of the Hamiltonhill housing scheme; Mrs. Agnes B. M'Donald, 149, Easterhill-street, Tollcross, cottage at Hillview-street, Shettleston; John M. Robertson, 2, Lancaster-crescent, Kelvinside, drill and recreation hall off Whitefield-road, Govan; Corporation Housing Department, houses and form streets and sewers at Norham-street, Frankfort-street, Dinmont-road, and Durward-avenue; Corporation Parks Department, bandstand at Kelvingrove Park; William Miller, joiner, 186, Trongate, bungalow at 50, Fernleigh-road; Bank of Scotland, alterations and additions to subjects at south-east corner of Renfield and St. Vincent-streets. The cost is estimated at £43,000.

GOSFORTH.—The M.H. have sanctioned the application of the U.D.C. to borrow money for the contract for 30 houses on the Coxlodge Estate, the sums being £11,340 for erection of 30 houses, £702 for street works and gas mains, and £155 for sewer works.

GREAT HARWOOD.—Land at Lidgett has been secured as a site for a new Spiritualist church.

GUILDFORD.—Plans passed by T.C.: House, Bray-road, by C. J. Mitchell, for E. Sibbald; house, Madrid-road, by T. Martin, jun.; two houses, Stockton-road, by Mr. A. J. Grove; house, Ennismore-avenue, by A. C. Burlingham, for V. Ellis; house, Mountside, by L. R. Hiscock, for B. Hardy; house, Avonmore-avenue, by H. W. Frampton & Co.; pair of houses, Madrid-road, by W. J. Grove; bungalow, Harvey-road, by H. Ascroft, for Mrs. L. N. Searle; pair of houses, Bray-road, by Hodgson, Lunn & Co., for S. Battersby; pair of houses, Grange-road, by W. G. Sheppard for Mr. Warrener and Mr. Waltham; house, Worplesdon-road, by W. G. Sheppard; new road and lay-out, Pewley Hill, Poyle Charity Estate, by F. J. Hodgson.

HEYWOOD.—A proposal has been made to erect a market building on the Hind Hill.

HIPPERHOLME.—Plans passed by U.D.C.:—Two houses for the Rev. George Watkinson.

HOLMES CHAPEL.—A new social club is to be erected in Station-road by the Wall-paper Manufacturing Co.

INCE.—The Board of Education has sanctioned the erection by the D.C. of clinic adjacent to the Council offices.

IMMINGHAM.—The Wesleyan Methodist Church Council propose to erect a new church, with seating accommodation for 350, at an estimated cost of £4,130.

KENILWORTH.—Plans have been approved of a house in Warwick-road for Mr. Vaughan.

KEIGHLEY.—Plans passed by R.D.C.:—Four houses near Scott-lane, Riddlesden, for Mr. A. Smith; 10 houses in Banks-lane, Riddlesden, for Mr. T. Moore; two houses in Carr-lane, Riddlesden, for Messrs. Barker & Gledhill; bungalow at Sandbeds, Bradford-road,

Messrs. Robert Ingham Clark & Co., Ltd., of West Ham Abbey, London, have added to the number of their branch factories by the formation recently of Robert Ingham Clark & Co. (Scotland), Ltd. The new company with which is incorporated Messrs. Dowie & Smith, of Renfrew, has taken over that firm's works, which have been reorganised and brought up-to-date. Mr. R. H. Ingham Clark is chairman of the board, Mr. P. G. Dowie managing director and Messrs. F. W. F. Clark, Hugh Smith, J. M. Christie and F. R. Forfar directors.

THE SCOTTISH BUILDER

BUILDING FROM WASTE MATERIALS

Mr. W. HANSEN RAWLES, of Belmont, in a letter to the *Times*, commented on the suggestion by the Health Ministry to open derelict brickyards in various parts of the country to ease the present brick shortage. He asked if it would not be more advantageous in many cases to follow the example set in America and on the Continent to make the clinker, the waste product obtained from the municipal refuse destructors and from electric power stations, into good hard concrete bricks? These, if properly made, are equal to, and in several characteristics superior to, ordinary clay bricks. This waste material thus becomes a useful building material produced at a lower cost than burnt clay. Millions of clinker concrete bricks are produced annually on the Continent and in the United States.

Professor A. T. Laurie, of the Heriot Watt College, Edinburgh, had, in lecturing on the same subject, drawn attention to the utilisation for this purpose of blast furnace slag, cinders, and clinker, and burnt shale from the stills of the oil industry. He mentioned three ways in which these could be utilised—for the production of bricks, for the production of cement, and as aggregate mixed with Portland cement or plaster of Paris. The general method of produring bricks by the sand lime process consisted of mixing the aggregate with a certain proportion of lime and water, squeezing it into a brick of some 200 tons to the area of the brick, and then steaming under high pressure. Bricks were now being manufactured by this process from sand, blastfurnace slag, granulated by being run while hot into water, clinker, town refuse, slate dust, and burnt shale. Cement was being manufactured by two of the Scottish steel companies from blast furnace slag granulated, mixed with lime, and then raised to a high temperature, so as to form a clinker in the same way as ordinary Portland cement was manufactured. Professor Laurie had made the suggestion that a very useful cement could be made of the burnt shale of the Scottish oil shale dumps, grounding with a certain proportion of slaked lime. These shale dumps were an eyesore at Broxburn, Straiton, Oakbank, Dalmeny, and wherever oil works had been established west of Edinburgh. There were two methods of manufacture—the "Crozite," or common American; and that of the Triangular Construction Co. In America, all kinds of materials required by the builder had been turned out made from plaster of Paris as the cement.

BUILDING TRADE WAGES IN SCOTLAND.*

THE following are the present rates of wages in the building trade in the principal towns of Scotland. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur:—

	Masons.	Brick layers.	Carpenters, Joiners.	Plasterers.	Slaters.	Plumbers.	Painters.	Brick-layers' Labourers.	Masons' Labourers.	Plasterers' Labourers.

NEW BUILDINGS IN SCOTLAND.

Fraserburgh.—PAVILION.—The T.C. has decided to adopt the Burgh Surveyor's plan for a pavilion on the Esplanade, the estimated cost of which is £700.

East Wemyss.—CHURCH.—At a meeting of the Kirkcaldy United Free Presbytery held recently it was stated that an early start was proposed with the erection of a new church at East Wemyss.

Windygates.—CHURCH.—It was stated at the recent meeting of the Kirkcaldy United Free Presbytery that a gift of £2,000 has been received towards the cost of a proposed church at Windygates.

Saltcoats.—CONVERSION.—The T.C. proposes to convert their milk depot into a tenement building containing eight houses.

Aberdeen.—INFIRMARY.—It was stated at a recent meeting of the Royal Infirmary Board that a site had been approved, at Foresthill, and that an offer had been made to purchase the portion of the site required for the Infirmary at a cost of £11,000. The Links and Parks Committee propose to carry out painter work and repairs at the bathing station, at an estimated cost of £584.

Rutherglen.—HOUSES.—Authority has been given to the T.C. to accept tenders, which amount to £15,000, for the erection of 32 houses, which comprise the third instalment of its housing scheme.

Alloa.—HOUSE.—The Dean of Guild Court has passed plans for a house off Tullibody-road, submitted by Mr. James Miller, Shaftesbury-street.

Ayr.—HOUSES.—The Dean of Guild Court has passed the following plans:—R. W. Hutchinson, two houses at Falkland Park-road, at a cost of £1,200; J. Leggat & Sons, four houses at Hawkhill-avenue, at a cost of £3,400; H. H. Mills, Ayr, a house in Doonfoot-road, to cost £1,600; and Quinton Clark, two houses in Bellesleyhill-road, to cost £1,490.

Girvan.—HOUSES.—The T.C. propose to borrow £12,000 for the erection of 28 houses in Back-road.

Ban on Bonus System.

At a recent meeting of the Glasgow Town Council, discussion arose as to whether payment by results should be prohibited. The bonus system was opposed, and the Labour members also supported this view on the ground that "rush" work would lead to jerry building. On a vote the minute containing the ban on piece work and the bonus system was carried by 47 votes, against 46 votes for the deletion of this proviso.

Kirkcudbright.—MARCH 1.—POST OFFICE.—New post office at Kirkcudbright. Tenders for whole trades and not separately. Schedules from the Architect, H.M. Messenger; 14 houses, All Saints'-avenue, P. Levett; saloon, Clifton Baths, C. S. F. Palmer; additions, 21, Sweyn-road, Wood & Co.; house, Arundel-road, R. A. Harris; house and garage, road near Kingsgate, F. Sutton Smith; two houses, Westcliff-gardens, W. R. H. Gardner.

MIDDLESBROUGH.—The T.C. have approved 17 sets of plans, submitted by its Plans Committee, including 15 houses.

MIDDLETON.—Plans for the erection of new public baths in Suffield-street and Corporation-street have been submitted to the Corporation by the Borough Surveyor.

MIRFIELD.—A new club is to be erected as a permanent place of recreation for the local Ex-Service Men. A site has been acquired and plans are being prepared.

MONMOUTHSHIRE.—The Mynyddislwyn U.D.C. has applied for sanction to proceed with the Blackwood-road widening scheme.——Schemes, under Miners' Welfare Fund Committee auspices, for lay-out of recreation grounds, &c., are to be put in hand at New Tredegar, Pengam, Fleur-de-lis, Aberbargoed, Ystrad Mynach, Pontlottyn, Rhymney, Bargoed and Nelson. A grant of £2,500 has already been received by the Bargoed and District Local Welfare Committee (Secretary, Mr. J. Edwards), for the district scheme, from Central Fund.——Further large scale works extensions are to be put in hand by Messrs. Whitehead Iron and Steel Co., Ltd., at Newport.

NELSON.—The Borough Surveyor has been instructed to prepare a scheme for the erection of 50 additional houses. Tenders have been accepted for the erection of 19 houses on the Marsden Hall-road site.

NEWCASTLE.—The Town Improvement and Streets Committee have approved plans for the erection of a further 24 houses.

NEWMARKET.—The U.D.C. has granted housing subsidies to T. Allen (Soham), Lionel Dawson, Lowther-street; E. H. Southgate, 21, St. Philip's-road; E. C. B. Pilgrim, Falmouth-street, and the Exning Unionist Club.

NORWICH.—The T.C. has approved of a scheme for the erection of 1,000 houses.

NOTTINGHAM.—The C.E.C. propose to approach the B. of E. for their sanction for the erection of three new Elementary Schools at Bulwell, Old Rasford and Hyson Green.

OLDHAM.—The Buildings Committee has approved plans for eight houses to be erected in Melling-road.

OKEHAMPTON.—Subsidies have been granted by the T.C. to Mr. J. Avery for 24 houses in Barton-road, and J. J. Sleeman for six houses in Mill-road.

PEMBROKESHIRE.—The County Small Holdings Committee has agreed to the erection of buildings at Chapel Farm, Ford; at Good Hope, Llysfran, Pallau, East Johnstone, Croft Holding (Llysfran); new house or bungalow at Hubberston; repairs at Chapel Farm, Castlemartin; conversion of buildings at Tre Gynon; repairs at Trefwynt, Trebeorth, and East Johnstone.——The Goodwick U.D.C. has in consideration erection of public slaughterhouse.

PORTADOWN.—The U.D.C. has approved of plans from Messrs. Thomas Hyde & Sons, Portadown, for the erection of 14 houses in Cecil-street, four houses in Queen-street, for Mr. R. McKeown, and a villa in Thomas-street, for Mrs. Rountree.

POOLE.—The T.C. has decided to ask the M.H. to allow subsidies for a further 150 houses and to proceed with the erection of a further 74 houses. Loan sanctions have been issued by the M.H. in respect of £11,861 for the erection of 26 houses by the Council, and for sums of £13,300 and £22,111 in respect to housing assistance.

RAWTENSTALL.—The General Purposes Committee has decided to erect eight houses at Cloughfold.

REDCAR.—The T.C. is to apply for permission to borrow £10,000 for water main extensions in anticipation of building developments.

RICHMOND (YORKS).—The T.C. has approved plans, submitted through its Sanitary and Housing Committee, for the erection of 10 houses in Queen's-road, and 22 in the Garden City.

ROCHDALE.—Provision is being made for the erection of public conveniences in connection with the covering of Wellington Bridge to Weir-street.—The members of the Rochdale Motor Club are considering the question of the provision of a club-house.——The Wesleyan Methodist Church Council propose to erect a new church with seating accommodation for 2,000 persons, at an estimated cost of £6,9788.

SOUTHAMPTON.—A movement is on foot to obtain a permanent site for a new church of St. John at Shirley.

SOUTHEND-ON-SEA.—In connection with Cliff Town Congregational Church, efforts are being made to collect £10,000 towards the cost of a new lecture hall, and it was announced recently that over £80,000 was in hand.——The church of St. Michael's, Leigh, is appealing for funds to enable the building of a parish church to be commenced. Plans have been prepared by Sir Charles Nicholson, and the cost is estimated at £10,000.——Club premises are to be established in connection with the Ambassador's Theatre, and it has been decided to acquire premises on the Westcliff-parade.——The Education Committee has submitted its revised programme of school building, and this includes a senior elementary school for 450 boys and girls to be erected on Coleman's Estate site; and open-air school on the same site for 100 children; and two additional class-rooms are also to be provided at West Leigh School.

SPALDING.—The R.D.C. who have had some houses built at £388 each, have instructed their architects to prepare plans for the erection of houses at £300 each.

STALYBRIDGE.—The E.C. is preparing to convert West Hill into a school.

THORNABY-ON-TEES.—The T.C. has passed plans for 17 houses on the Cobden-street Estate, for Stockton Co-operative Society, and a cinema in Mandale-road, for Mr. G. T. Alderson.

THORNE.—The R.D.C. has approved the lay-out of the Hatfield Parks Estate. It contains some 400 acres of well-wooded land, a first section fronting Station-road having been purchased by the Hatfield Main Colliery for the erection of 160 workmen's dwellings, while they have secured an option on a further section upon which there is space to build 250 more. The higher ground adjoining Thorne-Doncaster main road is to be laid out for the provision of detached and semi-detached houses of the "country suburb" type.

THORNTON.—A banking company has purchased the cottage on the south side of Four Ends, on the site of which it is proposed to erect a bank.

WALTON-LE-DALE.—The Highways Committee has instructed the Surveyor to ascertain the cost of the removal and re-erection of the building at the corner of Belle-lane and Hoghton-lane.

WALSALL.—The E.C. has decided to immediately invite tenders for the erection of a new Junior School at Willington-square.

WALTON (SURREY).—James Burns & Co. have applied for a subsidy for 50 houses which it is proposed to erect in the Molesey-road.

YARMOUTH.—Plans passed by T.C.: House, Heathcote, Marine-parade North, for Mr. E. Taplin; house, Alexandra-avenue, J. Balls & Sons, and another for Mr. Cole; house, Elm Grove-road, Gorleston, Mr. C. J. Wiltshire; house, John-road, Gorleston, Mr. D. Green; nurses' quarters, Yarmouth Infirmary, for the B.G.; alterations, 175, King-street, Mr. David Grig; house, Bernard-road, Gorleston, the Gorleston Cliff Estate; five flats, South Quay, Mr. R. W. Clarke; house, Hamilton-road, Mr. J. E. Pestell; two, same road, Mr. H. A. Holmes; four houses, Balmoral-avenue, Messrs. Ames & Leach; four houses, Albemarle-road, Gorleston, Mr. H. C. Downing; bungalow, Colomb-road, Gorleston, Messrs. Crow & Palmer; eight houses, Clarke's-road, Gorleston (Pound-lane Building Estate), Mr. H. R. Middleton.

FIRE.

BARRY (GLAM.).—The Wyndham Conservative Club and Institute, Harbour-road, Barry, has been destroyed by fire. The damage is placed at £10,000.

TENDERS.

*Messrs. Stoke Bros & Ward—(1) £257, (2) £538.

TRADE NEWS.

The "Whitehall" cowl, illustrated herewith, has been put on the market by Mr. C. White, of 46, Parliament-street, S.W. 1, as a positive preventive or cure for down-draught and smoky chimneys. There are no mechanical movements and there is thus no fear of disarrangement,

and it is silent; it is claimed that this cowl does not obstruct the brush when sweeping, that it is equally effective with any fuel, that it aids ventilation, that it can be applied to any chimney, and that as it can be produced in two parts it is adaptable to high chimneys which are swept from the top with ball and rope.

Colour Schemes at Wembley.

The great possibilities of colour contrast as applied to house decoration will be shown in the Palace of Arts at the British Empire Exhibition. A model dining-room and hall, the designs for which Lord Gerald Wellesley and Mr. Trentwith Wills are responsible, represent the domestic arts of Great Britain, as decided in competition by a selecting committee of artists, architects, and designers. Messrs. Gaze, of Conduit-street and Kingston-on-Thames, have been selected to carry out the work.

THE BUILDER

A JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR.

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

VOL. CXXVI.—No. 4231. MARCH 7, 1924.

POSTERS AND RAILWAY STATIONS.

THE announcement that seventeen members of the Royal Academy have been commissioned to design posters for the London Midland and Scottish Railway Company, opens up a new chapter in the history of British art, though we must not forget the excellent work in this direction which has been done by the Underground Railways. The incident has been hailed everywhere by the public Press as a distinct advance in the progress of public taste. We need not humbug ourselves about the dual role of the poster primarily designed to advertise and at the same time inculcate a love for the beautiful; nor need we waste any time discussing the philosophy of public taste in relation to an art which has been thrust upon it. So far as we are aware the public has had small choice in the matter, but apart from any question of motive we think nothing but good can come from this new development.

The significant facts to us—in what the newspapers rightly term an enterprise—are that artists have bridged the gap between commerce and art, and that the alliance has been met everywhere with approval. The policy of the Railway Company is not, we assume, to convert its stations into "outdoor galleries" for the sheer love of art; nor can we assume any difference in principle between posters of places and posters to advertise nerve tonics. The simple truth is that we have found the theory of art for art's sake to be difficult to maintain (if we ever really believed in it) in a world which has steadily refused to believe in fine art relegated to a spare-time hobby. On the other hand, the conventional view of fine art has been responsible for the limited sphere which art has occupied, regardless of any social responsibilities.

There are many directions in which we would like to see an alliance between commerce and art, but there is something ironical in the fact that distinguished artists should come to an important decision and lend their aid in the most extreme development of a commercial age. We have no objection to the theory that if we must have posters let us have the best; we merely record it and leave the philosophy to future historians.

In our opinion the two important points which should be of interest to all architects are these: that the art of painting has not only given a definite lead in the relations between art and commerce, but it has indirectly encouraged advertising by assisting to raise the artistic level of the poster. As we have indicated, we are not impressed with the poetic ideals which would convert railway stations into picture galleries and provide opportunities for educating public taste. Nor do we see why our railway stations should be the dreary and depressing places in which we are compelled to while away a certain amount of our time. We can only conclude that if railway companies believed there were anything to be gained financially by giving us better designed and less ugly stations we would see a desire to improve them, with or without the posters. We assert that any architect of moderate attainments could design railway stations which would give an added joy to railway travelling. It is difficult to conceive anything more depressing than the monotonous stations throughout the country, all designed at headquarters and all alike in standardised materials. Not the slightest attempt is made to consider local materials or traditions characteristic of the country, and the presence of a refreshment bar is the sole distinguishing mark for railway travellers.

We raise the questions whether railway companies will now consider the architectural appearance of their stations, and whether architects would see their way to enter into the spirit of this popular movement to raise the standard of public taste!

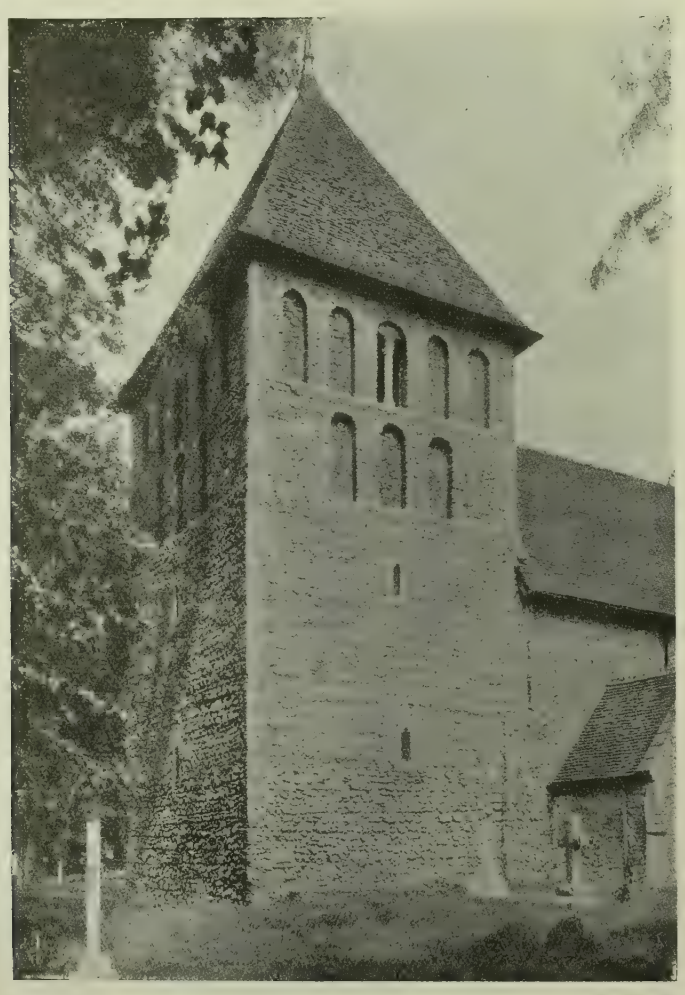
We bear in mind that there is a world of difference between painting and architecture, and that the artist's objective is not always easy to define. Painting is a conventional art, or, as Hazlitt puts it, "In writing, you have to contend with the world; in painting, you have only to carry on a friendly strife with Nature." Architecture, on the other hand, is perpetually engaged at every point with the practical and utilitarian things of life. It is a structural art, and for these reasons the attitude of the architect, as an artist, is infinitely more complicated than that of the painter. The painter may adhere to any exclusive theory without disturbing the public; the architect, lacking the unfettered freedom of the painter, may, and frequently does, try to adhere to some æsthetic philosophy, and the public may suffer (or may not) if the elusive ends of civilisation do not compel him to adjust his outlook.

We are back again at the position we have been discussing in these columns for several months—the relation of architecture to commerce. It would be more accurate perhaps to state the problem in terms of the architect in relation to commercial values. There is no subject which opens up a wider vision to the architect than this search for the true interpretation of commercial architecture, and there is no subject so deserving of attention. There are many subjects of which it might be said that it does not matter what we think, and we know that this view is held by many thoughtful people in regard to architecture. The inference, as we gather it, is that architecture does conform to life whether architects are aware of it or not, or whether they approve or disapprove of our social development. We have been told that it does not matter what architects think; it is what they do. We have always preferred to invert this thought in our minds, believing that the only approach to living architecture must be based upon logical reasoning.

We recommend the young architectural student to work out for himself a working philosophy dealing with commerce and art. If he begins on the assumption that commerce is wrong he will get no farther, but, taking a lead from the recent attitude of the painter, he may be able to outline what he thinks should be the true architectural expression of commerce. We know what commerce can express at its worst; we think we know what a civilised people would try to express. If commerce must be kept in its place, he must define what that place is, and still be able to show a fine reserve of power.

The student must learn to deal fairly with many buildings he has come to regard as "commercial" because they are failures. The fault does not lie with commerce because of the assumption that it is incapable of any decent architectural expression; on the contrary, the architect in the past has failed partly through inability and partly through unfortunate compromises. An impartial historian may not consider our commercial architecture to be full of inspiration, but we can hardly expect him to analyse whether it was as good and no better than the commodities which the buildings were designed to sell.

It is a characteristic touch that just when the public is promised more artistic posters, certain companies should wisely decide to remove their roadside signs from rural districts. And so the day is coming when it will be a better advertisement to refrain from advertising on buildings, when the architect will realise that fine architecture is its own advertisement when it has need of none.



NOTES.

The R.I.B.A. Gold Medal.

Professor Lethaby's inability to accept the Royal Gold Medal which the Council of the Royal Institute of British Architects proposed to award him has already been the subject of a good deal of inevitable comment, as no doubt it will be for some time to come. It recalls the similar action of Ruskin, but whereas he declined the honour as a protest "against the artistic vices of the age," the only explanation we have of Professor Lethaby's refusal is contained in the announcement by the President of the Institute at the meeting on Monday: "I am not able to-night," said Mr. Gotch, "to follow the usual formula suitable for the occasion, because Professor Lethaby, owing to certain personal scruples and his extreme modesty, feels it entirely out of his power to accept the medal; that being the case, it is needless to go on with the election, and the Council have decided that no further steps be taken with regard to the Royal Gold Medal this year." While we regret Professor Lethaby's decision, we are bound to respect the scruples of any distinguished man who declines a well-merited and unanimously proposed honour; but at the same time we do not understand why any such nomination should be made public until some preliminary assurance of acceptance is obtained. Failure to do so creates general embarrassment, and may lead to much misunderstanding. As it is, no one will think the worse of the distinguished Professor for his refusal of the honour, nor of the Council of the Institute for its desire to bestow it.

The Bestowal of Honours.

A correspondent writes:—"Whatever the reasons which may have decided Mr. Lethaby to decline the Gold Medal of the R.I.B.A., and we are in no position to assume what they may have been, his decision is not without significance. The bestowal of honours has been so much at random, and so much the endowment of those who sought them, rather than those who sustained them, that their value has become much discounted. The influence of such honours varies according to the qualities of the recipients; in some cases, no doubt the majority, the society honours the individual; in a very few, and perhaps the only important cases, the recipient confers an honour on the Society in accepting it. But if it is seen in a majority of cases that the bestowal of an honour is the reward of much self-seeking for it, and that this influence clouds the lustre which should belong to the bestowal of honours, the really best men will look askance at the whole thing, feeling, like the classic example, it more likely they will be remembered without a statue! And such is the case to-day. A generation or two has to pass before, as the result of the lapse through time of so many of the indiscriminately bestowed honours, the atmosphere is once more clear enough to distinguish more truly, and the bestowal of honours justified again as given only, not to those who seek them, but to the best, who deserve them. And we have had to notice of late that this has seldom been the case."

Late Eleventh-Century Tower, St. Mary's, Corringham, Essex.

The Fine Arts Commission.

The appointment of Mr. H. Chalton Bradshaw as secretary to the recently-appointed Fine Arts Commission is another tribute to youth; but, though a young man, Mr. Bradshaw has had many notable successes as an architectural student, while as a practising architect he won, in collaboration with Mr. G. Ledward, sculptor, the open competition for the Guards' Memorial. Mr. Bradshaw received his architectural training at the Liverpool School of Architecture, under Professor Reilly, and besides securing the Lever prize he won the Rome Scholarship in Architecture. During the war he served in the Somme battle, at Vimy Ridge, and Passchendaele, and afterwards went to Italy, where he distinguished himself, was promoted to the rank of captain, and was awarded the Croix de Guerre. Such an appointment carries with it great possibilities, and we must all hope Mr. Bradshaw will fulfil them.

The Chaos of Traffic.

The streets of London are rapidly approaching a condition of chaos, writes Mr. H. V. Lanchester, and when we consider what an important feature of the daily life and well-being of our cities this matter of transport is we could suppose that it should be one of the most vital of all our problems. That the building of St. Paul's Bridge will affect it goes without saying, but—how will it affect it? Can anyone, whether inclined for the bridge or against it, pretend to forecast with any close approach to accuracy the result of such a new bridge? No one can have noted the congestion at Oxford-circus without regrets for the present state or apprehension for the future. When will the state of things become quite intolerable? Mr. Lanchester's article in the *Daily News* is very pertinent and timely, and it is only one of numerous calls from experts for some drastic remedy.

A Conference on Suburban Traffic.

The Traffic Board to be set up if the Bill shortly to come before Parliament becomes law will certainly be more of a critical than an imaginative character,

says Mr. Lanchester, who finds the main difficulty in suburban traffic to lie in the position of the termini which leave passengers in the condition of a half-finished journey which they have to resume by 'bus or tube. Amongst the suggestions he offers is a dive down by a spiral tunnel where the terminus is a large one. The gist of Mr. Lanchester's criticism lies in the suggestion that the various railways should confer together on this important matter and lay certain proposals before the Traffic Board. Here, at any rate, is a practical suggestion—not something to argue about in a detached and platonic way, but to set about immediately. Here we have an admittedly great evil and a sensible suggestion for its remedy. Will anything be done?

London as a "Corridor."

THINKING for fifty years hence, a writer in *The Times*, Mr. Rees Jefferys asks if London is to be made a "corridor" for traffic passing through it from north to south. If the City of London is a natural and proper "corridor" for the daily increasing traffic of Greater London, then build St. Paul's Bridge and face the large expenditure in street widenings and loss of rateable value which it will entail, says the Roads Improvement Association.

The Rural Industries' Bureau.

THE series of leaflets issued by the Rural Industries' Intelligence Bureau, from whom we have received copies and to which we propose later to refer at greater length, contain much that is very helpful and encouraging, as showing the awakening to the need of restoring village life and country industries. These leaflets, which are reprinted from the *Journal of the Ministry of Agriculture*, deal not only in general terms with the subject, but make suggestions and offer instruction on various definite industries connected with country life, such as metal work, wood work, basket-making, hand weaving, and spinning; also other industries, which, it is hoped, may be fostered, such as the utilisation of straw, peat, and waste products. The Committee of the Bureau is a large one, and includes various names well known for their association with home and country interests. The aim, so important, is one of too much complexity for organisation alone to achieve, and the Committee seems rather overweighted on this side, as if the economic and administrative sides were regarded as sufficient in themselves; while there is a regrettable absence from the Committee of the names of well-known craftsmen or men with first-hand practical acquaintance with materials.

"Great Sir Hughes": Early Seventeenth-Century Building at Great Baddow, Essex. (*See p.* 373.)

Lord Curzon and St. Helena.

THE Marquess Curzon of Kedleston, in his "Tales of Travel," just issued, says that before going to St. Helena in 1908 he made a careful study of every available book about Napoleon's residence in that island. Consequently, when he entered "Longwood," the scene of the Emperor's five years' exile and ultimate death, he "was familiar with the identity and history of every room in the building as though he had lived in the house himself." This knowledge was put to an unexpected test. On his entering the building for the first time the French Consul was about to conduct a party of French visitors round the premises. In the entrance room, upon the walls a notice was hung, "Salle d'Attente." Here the uses of the apartment were being expatiated upon as having happened during the days of Napoleon. "This," said the Consul, "was the reception room where His Majesty received his guests." "Excuse me," interjected Lord Curzon, "this was, at any rate, in the first few years of the Emperor's residence, the billiard room, and the room was always known and described as such." The Consul had never heard of this and observed that as the gentleman who had spoken seemed to have a greater acquaintance with the contents of "Longwood" than himself, "perhaps he would take the company round." Thus Lord Curzon acted as guide in a house he had never previously seen.

Academic Dress.

AT a meeting of the R.I.B.A. on Monday, Mr. C. Ernest Elcock's resolution, "That the resolutions on the subject of Academic Dress passed at the general meetings on April 30, 1923, and on January 7, 1924, be rescinded, and that no further action be taken in the matter of the proposed Academic Dress," was passed by 45 votes to 22. With such a big majority in favour of this resolution, we hope the matter will now be allowed to rest.

GENERAL NEWS.

Professional Announcement.

Mr. Henry F. Mence, Surveyor to the St. Albans Rural District Council, has taken into partnership Mr. Leslie Ross, A.R.I.B.A., as from March 1. The firm will continue to practise as architects and surveyors, under the title of "Mence & Ross, A.R.I.B.A.," at 11, St. Peter's-street, St. Albans, Herts.

Liverpool University.

At a meeting of the Council of the University, held recently, it was agreed that the title of Associate Professor be conferred on Mr. L. B. Budden, M.A., A.R.I.B.A., Senior Lecturer in the Theory and Practice of Architectural Design in the School of Architecture.

Architects' Estates.

Lieut.-Col. Stephen Leonard Tennant, R.E. (T.F.), of Ballidon, Wilbraham-road, Alexandra Park, Manchester, architect (net personalty, £67,714), £69,819.

Mr. Charles Edward Clayton (50), of Prince Albert-street, Brighton, and Holmbush Lodge, near Henfield, architect and surveyor (net personalty £10,155), £29,221.

Mr. Edwin Rutherford, of Rector View, Shincliffe, Durham, formerly of Durham, architect's assistant (net personalty £3,262), £5,501.

University of London.

We take the following extracts from the annual report of the University of London :—During the Session 1922–23, the total number of students enrolled was 3,005. Of the total, 2,490 students came from homes in the United Kingdom; 206, including 75 post-graduate and research, came from various parts of the Empire. The report also includes a summary of the work of the two special Schools of Architecture and Librarianship, showing that these two schools are working effectively. The Bartlett School of Architecture, which combines the work at one time carried on separately at King's College and University College, is now housed in the building provided by the late Sir Herbert Bartlett, and is under the direction of Professor A. E. Richardson. It includes a day school, an evening school, and a post-graduate atelier. There is also a Town-Planning Department, under the direction of Professor S. D. Adshead.

Soane Museum.

Sir John Soane's Museum reopened on March 4. It is open free to the public, 10.30–5, on Tuesdays, Wednesdays, Thursdays, and Fridays, during March, April, May, June, July, and August. At other times by cards obtained from the Curator.

Lincoln Cathedral.

At a recent lecture at Lincoln Sir Francis Fox referred to the work which had been done at St. Paul's, Winchester, Exeter, and Lincoln. The damage at St. Paul's was due, he considered, to mistakes in design and bad foundations; at Winchester to the cathedral being built on a bog; at Exeter to the roof having slipped during erection; and at Lincoln to an earthquake.

During the course of his lecture Sir Francis Fox complimented those responsible for the scaffolding on the north-west tower at Lincoln, which, he said, was a monument of skill and ability.

Architecture Club Exhibition.

The Architecture Club's second exhibition at Grosvenor House, which the Duke of Westminster has again placed at the disposal of the Committee, will be opened by the Marquis Curzon of Kedleston on March 11, and will be open to the public from March 12 to April 17 inclusive. The exhibition this year, under the title of "British Architecture of To-day," will comprise four sections—"Recent Architecture" (since the war), "Gardens" (of the last 20 years), "Housing" (since 1913), and "Memorials." The exhibits will consist of large photographs and models, and in addition to models of modern buildings there will be a display of garden statues and pottery by Mr. and Mrs. Harold Stabler, Mr. Percy Bentham, Miss Anne Acheson, Miss Phyllis Clay, Mr. Alec Miller and others. Lady Constance Hatch has made another collection of "Old Models," which includes a series of twenty-seven models of English and French cathedrals, lent by the Dean and Chapter of Canterbury, and Barry's models for the three towers of the Houses of Parliament, lent by H.M. Office of Works. A continuous lantern show will again be provided, and a special rota of lecturers will supply informal afternoon talks with the lantern views.

COMPETITION NEWS

Truro Public Hall.

The assessor, Sir A. Brumwell Thomas, F.R.I.B.A., has made the following award in this competition :—

First (£100): Messrs. Thornely & Rooke, of Prince's-square, Plymouth.

Second (£50): Mr. F. G. Drewitt, of Messrs. Cowell, Drewitt & Wheatley, of Penzance.

Ebbw Vale Memorial.

The design of Mr. R. Evans, the Craftsmens' Guild, 64, The Oval, London, has been selected in this competition.

Other Competitions.

Other competitions still open include the following (the dates given are, first the sending-in date, and second the issue of *The Builder* in which full particulars were given) :—Essays on Heating and Ventilating (Mar. 31; Nov. 9, 1923). Industrial Designs (June; Dec. 21, 1923). National Theatre (April 26). Monument to Sir Wilfrid Laurier (April 3; Dec. 14, 1923). Belfast Union Lighting (March; Nov. 9, 1923). Dunfermline War Memorial (March 8; Dec. 28, 1923). Ross-Smith Memorial (Sept. 30; Feb. 1). Newcastle Fire Station (March 27; Feb. 1).

Little Warley Hall: Early Sixteenth-Century Building at Little Warley, Essex. (*See p.* 373.)

ITALIAN TRAVEL NOTES.

BY THEODORE FYFE.

III.—VERONA, VICENZA, PADUA AND VENICE.

There are surely very few towns in the world that have so much charm as Verona. There are really several towns in it, each with its separate atmosphere, but all merged into what we know as "Old Verona." Strategically, it has an important position, as the Brenner Pass leads almost directly from it, northwards, to Trent and Innsbruck in the heart of the Austrian Tyrol. The ancient part of the town lies in the hollow of a great bend in the swiftly flowing river Adige, so that two sides of it are river; and the third, or land side, is bounded by the mediæval wall which connected the two river points. San Michele's walls, with their great gates, mark the limit of expansion of this land side. There is also a little town-annexe (Veronetta), on the further bank of the river.

Verona is of first-class importance to the student in three aspects—Roman, Mediæval, and Renaissance. The Roman remains include the finest amphitheatre outside of Rome, in a wonderful state of preservation. The mediæval work is important in a dual aspect; on the one hand the Romanesque element, culminating in one of the finest churches in Italy—San Zeno Maggiore—and on the other hand, the Gothic element, in Sant' Anastasia, and the tombs of the family of della Scala (the Scaligeri); for it must not be forgotten that Verona is the western outpost of the province of Venetia, and the Venetian Gothic element is everywhere apparent. For Renaissance it is enough to mention San Michele, who can be studied at Verona as nowhere else. There are two important palaces by him—the Palazzo Bevilacqna and the Palazzo Pompeii—and the great gateways, the Porta del Palio and the Porta Nuova. Another notable piece of Renaissance work is the building known as the "Gran Guardia Vecchia," built after San Michele's time, early in the seventeenth century.

Though San Zeno and the Duomo are both wonderful buildings, and San Fermo Maggiore should not be missed, the most impressive mediæval building in Verona is its great church of Sant' Anastasia, a peculiarly fine building of the late thirteenth century, with a most complete scheme of colour decoration of the fifteenth century in its vaulting. The campaniles of these Veronese churches are most effective in the changing views one gets from the noble bend of the river. From this openness one can pass quickly into the crowded part of the town—the Piazza dei Signori, with its celebrated early Renaissance Palazzo del Consiglio or town hall. The whole of this region is dominated by the fine tall tower of the Municipio, and near by we can see the warrior tombs of the Scalas, with that strong Venetian influence that is so prevalent at Verona.

It is not easy to speak of the gateways of San Michele, but they are superb pieces of semi-military architecture by a man who was as much a great engineer as a great architect. Their approaches are excellent, particularly that to the Porta Nuova, with its avenues of lime trees. Between these imposing roadways and their gates and the market part of the town is the spacious atmosphere of the Piazza del' Arena. And so one has the whole content—the riverside churches, the picturesque mediæval centre, the Roman spaciousness, and the finely conceived outskirts—that makes up the unapproachable charm of Verona.

Vicenza is the next important town on the line to Venice. It is undeniably an old-world town with a flavour that is all its own, though it is rather dirty; and it must be seen for Palladio's work, if for nothing else. Even more than San Michele at Verona, Palladio is in complete evidence at Vicenza; and his work is always beautifully detailed, and often boldly and finely conceived. The important building known as the "Basilica Palladiana," the "Casa del' Diavolo" (a fragment), the Palazzo Prefettizio (designed as a triumphal monument after the victory at Lepanto), and the Museo Civico (in the Palazzo Chiericati), all deserve the most careful study. Nor should two others of Palladio's buildings be neglected. One of these is the curious little theatre—almost a toy theatre, it is so small in scale—called the Teatro Olimpico; the other is the more famous Rotunda—the prototype of Lord Burlington's villa at Chiswick—which is outside Vicenza, but should on no account be missed. Vicenza also contains an interesting Duomo, chiefly in Gothic, with some fine moulded brick cornices; and some good old bits of houses here and there, which give one plenty of sketching material in a morning ramble. There are two good columns in the Piazza dei Signori.

In Padua, which is quite near to Venice, the traveller will find many things of outstanding excellence, and one of them, the Café Pedrocchi, may be mentioned here, and it will certainly cheer his bodily man. But Padua, like Milan, contains a world's masterpiece in the Gattemalata equestrian bronze, by Donatello, and therefore must be considered as a place of pilgrimage. We can add to these a really great church—Sant' Antonio—some wonderful early Titians in the Scuola del' Santo, some equally great Mantegnas in the Church of the Eremetani, and the Aerna Chapel with its Giotto frescoes. There is also a spacious dignity about Padua, as we should expect in one of the most renowned seats of learning in Italy.

Sant' Antonio is the patron saint of Padua, and he seems to dominate the whole town. His Church certainly dominates the mind of the visitor. It is of great size and the grouping of the exterior is extremely picturesque and interesting. In its main lines the interior is one of the grandest in Italy, or, in fact, anywhere. The domes over the nave compartments, with their extreme simplicity of treatment, give one the effect of a Byzantine basilica. Completely decorated in colour (as one can see it ought to have been, from the fragment in the westernmost dome), it would have been splendid as well as imposing. The details of accessories are beautiful and the student could easily spend a week in such a place. The fine pulpit has been drawn by Nesfield, but there are bronze gates and massive candelabra, and an early Renaissance chapel of Sant' Antonio, which is full of feeling.

One could write at length about the other excellencies of Padua that have been mentioned, but they are too well-known to need description. The roof of the Eremetani Church is of wood, coved in tiers and coloured in blue and gold, an original and fine treatment. It can be compared to the somewhat similar one in San Stefano at Venice. The Church of Sta. Guistina has a very interesting Renaissance interior, the roofing especially being a fine study in vaulted and domical treatment. Mr. Bolton gives plan and sections in his valuable article on domical churches.

Finally, Venice. It is surely too great a subject to write much about in an obvious way. Be it pictures, or decorative schemes, or statuary, or bridges, or buildings, the student will find a wealth of example which is astounding. There are by-ways, of course, which might be missed, lesser but still beautiful things which would risk being crowded out, and there is also Torcello. A few of these by-ways might be mentioned. Venice is full of interesting Renaissance treatments in many of its smaller churches. There are, for example, San Salvatore, which has a fine interior by Sansovino. It is perfectly lit by lanterns and by high clerestory windows. The nave compartments are domed and the piers are double, carrying arches to the front as well as to the aisles. A somewhat similar church is San Fantino, but the nave is vaulted with a dome at the crossing only. The choir is also domed and is as satisfactory as anything in Venice after Sta. Maria dei Miracoli. Both San Salvatore and San Fantino are well worth making careful surveys of. Mr. Bolton has recorded the main lines of the former. The wood roof of San Stefano is interesting, a triple cove, decorated in colour and with carved and painted tiebeams. Another good interior in Venice is S. Francesco della Vigna, and it has also a fine façade.

The great church of San Giovanni e Paolo, forming a picturesque group with the Colleoni Statue, is in Lombard Gothic, and has some really splendid early Renaissance wall tombs in the interior. San Georgio dei Greci has a good and rather severe baroque façade, with a dome like the Miracoli.

The churches of Venice are legion, and they are full of interesting pictures, or rather, masterpieces. It is exceedingly difficult for the student to concentrate in such a place; and, in fact, unless one definitely goes there with a set purpose the chances are that little will be done; but there is always the consolation that wonderful places like St. Mark's or S. Maria dei Miracoli, or the Loggietta by Sansovino, are full of such beautiful detail that a great deal of smaller work can be done with ease. If the student has a camera it is very valuable in a place like Venice, as there is so much that he wants some record of and that he cannot overtake. On some quiet morning he should take a sandolo from the Riva and get ferried across the lagoon to Torcello. The great lonely basilica, with its simple tower, grouping finely with the domed church of Sta. Fosca, is full of charm both inside and out. There is a quietness and repose about the interior, enhanced by the perfect lighting of the small clerestory windows, that is not easily forgotten, and the apse arrangements are unique.

Sta. Fosca has a beautiful interior which is absolutely in scale, and with most interesting vaulting and domical arrangements. The marble columns and Corinthianised Byzantine capitals are just as good as those of St. Mark's.

R.I.B.A. ELECTIONS, MARCH 3.

At a business meeting of the Royal Institute of British Architects, held on March 3, the following new members were elected:—

Fellows.

A. S. G. Butler, London
B. Chaikin, Jerusalem.
J. B. F. Cowper, Hampstead.
S. J. Edwards, Colombo.
N. Jones, Southport.
H. L. Paterson, Sheffield.
W. T. Sadler, Streatham.

Associates.

H. R. H. Bath, Nairobi.
G. A. Beech, Victoria.
D. Brooke, Barnes.
E. H. Button, Bristol.
I. M. Chambers, Roehampton.
L. M. Chitale, London.
J. A. Coia, Glasgow.
G. H. Crickmay, London.
J. S. Curwen, Kendal.
J. D. Ferguson, Cambuslang.
E. C. M. Fillmore, West Bromwich.
E. M. Fry, London.
J. D. Grant, Ipswich.
T. Greenfield, Midhurst.
Edith G. Harrison, London.
E. H. H. Higham, London.
H. Hirst, Liverpool.
C. H. Hutton, Rock Ferry.
C. G. C. Hyslop, Kingston-on-Thames.
F. W. Knewstubb, Penrith.
C. R. Knight, Liverpool.
A. F. Lawrie, Johannesburg.
S. T. Parkes, Melbourne.
A. H. Powell, Reading.
T. S. Sutherland, Aberdeen.
R. W. H. Vallis, Frome.

MEETINGS.

Monday, *March* 10.

Surveyors' Institution.—Mr. J. C. Spensley on "Economic Effects of the Housing Subsidy and the Rent Restriction Acts." At 12, Gt. George-street, S.W. 1. 8 p.m.

Architectural Association.—Mr. Goodhart Rendel on "Gothic Survival." At 34, Bedford-square, W.C. 1. 7 p.m.

Wednesday, March 12.

L.C.C. Central School of Arts and Crafts.—Sir Banister Fletcher on "Early Christian Architecture." At Southampton-row, W.C. 1. 6 p.m.

CORRESPONDENCE.

R.I.B.A. Defence League.

SIR,—At a recent committee meeting attention was called to a letter signed by Mr. Maurice E. Webb, in which he refers to registration.

We beg to enclose a copy of the circular letter signed by us and dated January 31, 1924; you will see that the only reference in it to registration is as follows:—

"Our Committee wonders what reason is to be given now for the admission of several hundred men without examination. Surely the promoters of this foolish scheme will not attempt again to throw dust in our eyes by saying, 'If you admit these men, then you will get registration,' or words to that effect, for our Parliamentary Agents have shown how ridiculous and misleading such an assumption may prove to be. If every architect in England belonged to the Institute, the great difficulty would still be before us, namely, how to make out what is known as a 'public case.' For example, a kindred society of another great profession wanted registration, but ultimately had to abandon the idea, not on account of any opposition from its members or from any rival society, but because the society in question could not make a 'public case.'"

Mr. Webb writes that our circular letter "indicates clearly that the policy of this League is now definitely anti-registrationist for reasons set out in the circular." This entirely misrepresents our views; but Mr. Webb gives us another opportunity to remind your readers that the R.I.B.A. Defence League has always been and is still in favour of registration. In our letter of January 31st we gave the principal reason why we consider it will be so hard to obtain, and we did so at greater length in our letter of January, 1922, when we printed *in extenso* the opinion of the Parliamentary Agents of the R.I.B.A.

Whatever views your readers may have in favour of or against unification, or amalgamation with any society or societies, we feel convinced that a very large majority of the members of the R.I.B.A. are satiated with these constant attempts to undermine the status of the Institute. And the usual result of the initiation of such schemes is to stir up strife and resentment, and create bad feeling at the R.I.B.A.

The Defence League was founded to protect the interests of those who have entered the Institute in accordance with our charters and by-laws and has no other object.

ALFRED W. S. CROSS,
Chairman.
SYDNEY PERKS,
Hon. Secretary.

Mural Decoration.

SIR,—The article in your last number on "County Hall Panels and Mural Art," by Mr. Reginald Hallward, expresses most ably the present situation in regard to mural decoration. The present, almost universal, system of educating artists as mere easel picture painters and then turning them on to wall decoration could only end disastrously. It certainly seems strange that with so much notable work done by past generations of artists, in this particular sphere, the essential principles which govern this greatly neglected branch of art are so little understood.

Would it not be wise in the case of pupils showing a natural aptitude for this branch of art (I have had such pupils) to direct them to study the work of such men as Bennozzo Gozzoli, Perugino, Botticelli, Ghirlandaijo, Michael Angelo, Titian, Tintoretto, and Puvis de Chavannes, and the fine old English examples of the late fifteenth-century Gothic decorative art found on the rood-screens at Ranworth, Barton Turf and Cawston, in Norfolk. These works show a true understanding of the essential qualities necessary for all art associated with architecture as decoration. Mr. Hallward puts the whole thing in a word when he says:—"Mural art will not be fostered in any such way, but in a spirit big enough to project through the mural form of painting themes which express the national life at its noblest and best." Even if we admit (as a well-known artist once said to me) that fifteenth-century decorative art was art in its infancy, it was a robust and healthy infancy and much to be preferred to many of the specimens of decorative art of to-day which might be described as art suffering from senile decay. Mere realism, anatomy and draughtsmanship will never give us great decorative art. Greatness in this department is never found without a fanciful idealism combined with a spiritual and intellectual perception of the abstract beauty which must underlie all combinations of the arts of architecture, sculpture and decorative painting. The preconceived idea is the curse of all art of to-day. As Mr. Hallward has so ably stated, the "subject and treatment must be inspired by the site and environment." Anyone who has worked direct on the wall will understand what this means. The whole conception seems to be a growth almost independent of the conscious working of the mind of the artist. Questions of composition, scale, balance and grouping are suggested naturally without any effect of posing and models. Think of what Titian would have made of such a subject as, say, "The Lord Mayor's Banquet"; or Bennozzo Gozzoli of a "Coronation Procession"; or Ghirlandaijo of the funeral procession of a great soldier, sailor or statesman; or Botticelli of a religious festival; or Michael Angelo of a great earthquake. There is great hope for the future if we only perceive and admit our errors.

WILLIAM DAVIDSON.

Edinburgh.

The R.I.B.A. and Education in India.

SIR,—I was glad to read in *The Builder* that the R.I.B.A. is holding an International Congress on Architectural Education during the summer while the British Empire Exhibition is in full swing. It is a very good idea indeed to exchange thoughts and ideals with the representatives of the allied societies, and to set some scheme for the proper education of young architects on sound lines. Not only will this idea help our brother architects, but also a very comprehensive exhibition of designs of the various schools arranged by the R.I.B.A. will show the intellectual methods of designing and practice of the varied cultures, and consequently I am quite sure the creative force of the International Congress will produce the best results.

From the public realisation of Indian art and architecture in Great Britain, France and America, it looks as if it is a very great problem and of utmost importance for the R.I.B.A. to consider the appropriate methods for education in India suitable to the economic conditions and the requirements of the country, and it is desirable to know how the R.I.B.A is going to solve this problem at the next congress.

India possesses some buildings which are included in the seven pearls of the world, and by this fact the people of Europe and America know India has produced some of the best buildings in past years. Its arts and crafts have attained the poetic height and appear absolutely perfect creations of the mind of men expressed in buildings. The ancient civilisation in culture attaining the most wonderful effect in material, the intellectual and creative force in master builders of the ancient India, show the production of most successful results. They solved the problem of construction in varied materials suitable to the country of their time, and the monuments still standing illustrate the ideals of the people and to what extent they were developed and cultivated. The architectural question then for India's intellectual and economic interests is so great that it cannot be regarded as a mere technical matter which can be decided at sight.

India being a vast country, having a population of about 330 millions, it is rather surprising there is only one architectural school. This school has a five-years' course after matriculation examination of the Indian universities, working only for about two hours every morning. This is obviously not enough time for education, especially in a subject like architecture; the students cannot compress the necessary study into this short period.

The main difficulty before the authorities concerned is to organise full time studies, and unless this is practicable the system of educational methods cannot be changed for the better. Again, the standard of education at the present time and the facilities to the students for freedom in thought as the most essential part of architecture is lower than in the architectural schools in Great Britain or any other country.

After taking the five years' training in the school, the students enter their professional career (they are always draughtsmen when starting their career), and under some rules only recently have they been qualified for municipal licences to practise independently. Architects have to design buildings in accord with their thoughts, ideals and traditions, and it is only architects who can do this creative work. But the fact is ignored, and, in spite of it, trained men in the status of draughtsmen are made to work under engineers, and, in consequence, they are unable to develop their ideals for solving the practical methods on which architecture is based, and thus improve the standard of design relating to conditions of the country as are the architects of the other countries. Young architects in India must be taught on sound foundations, and ought to be given opportunities to know their ancient buildings in India and the traditional methods and constructions to carry on research on these lines, and then to think out the methods to be adopted in practice. They should also be given opportunities to solve the question of domestic buildings on sound lines.

I feel that these questions ought inevitably to come before the Congress, and therefore I hope the R.I.B.A. will appoint a representative of India to bring forward the facts and present needs of education, and to discuss the question with a view to finding some method of improving methods in architectural education, and raising the status of the architectural schools to the same level as those of Great Britain, so that the influence of the R.I.B.A. qualification be felt in India as in the Dominions.

L. M. CHITALE.

Oxford-circus Improvement.

SIR,—In considering Sir A. Yarrow's proposed obstruction, it ought to be recalled that the report of the Royal Commission on London Traffic contained a similar suggestion, but at two different points, and those probably the most congested in the whole Metropolis. It proposed what might be termed a "hogsback" from the summit of Blackfriars Bridge over Queen Victoria-street crossing, and Ludgate-circus to Farringdon-street.

Many other recommendations by that most important body still stand to be considered by any new Government proposing to take action in traffic improvement. In fact, as proposed recently, the best course would be to reconstitute the Commission to reconsider its findings of twenty years ago, with the view of bringing them up to date, and also of formulating "the well-considered plan" it considered essential, in the light of the changes that have occurred since. It is only fair that it should be allowed to do so, the entire venue and the whole situation having radically altered. Besides, there is a mass of new data and suggestions *en gros* to be considered whilst powers have been obtained and others are sought for projects regarding which great difference of opinion exists.

Moreover, the community has a right to expect that when action is taken this very costly report (£80,000), now in danger of being ignored, which took two and a-half years to prepare, should be dealt with in a fair and exhaustive manner, as it would be were the Commission itself reconstructed with some additional powers.

"O. B. I. T."

HISTORICAL MONUMENTS IN ESSEX.*

There can be no subject of more general interest than that presented by the attractive volume before us. Since it is of the first importance that we should all have a general knowledge of the priceless works of art and utility that have been bequeathed to us by past generations, so it is desirable that this knowledge should be imparted in as succinct, clear, and pleasant a manner as possible. The productions of the Royal Commission on Historical Monuments go a long way to achieve that end. That England is rich in historical buildings is not too widely known, and it is a pleasant revelation that so great a wealth of architectural beauty is contained within about one quarter of the area of a single county. The volume, the fourth and concluding volume of Essex, contains, in addition to the inventory proper, a preface by the chairman of the Commission, Lord Crawford and Balcarres; a sectional report with a list of those monuments especially recommended for preservation; a general survey of the whole county under the headings of Prehistoric and Roman, Anglo-Saxon and Danish, and Architecture (comparative review); a section survey; an armorial of the county; plates of illustrations of mouldings and masons' marks; a glossary of architectural terms; an index to all four volumes; and a map of the section. The work is copiously illustrated throughout by photographs, plans, sections and diagrams.

The volume contains an inventory of the monuments in 104 parishes in the south-east of Essex, or a district lying between the Blackwater and the Thames, and extending westwards from the sea to the river Beam and the outskirts of Romford. Within this area 658 monuments have been examined and reported on as to their date, materials of construction, general character, and their present condition, and the Commissioners recommend 43 of them as "especially worthy of preservation."

A building of particular interest described in the inventory is the chapel of St. Peter-on-the-Wall in the parish of Bradwell-juxta-Mare at the extreme north-east of the section. This is built across the foundations of the wall of a Roman Fort which is also described and illustrated. "The chapel," says the report, "is almost certainly that built by Bishop Cedd in *c.* 654 at Ithancester. It stands astride the former W. wall of the Roman station and originally consisted of an apse, nave, and W. porch, and possibly 'porticus' on the N. and S. A tower was subsequently added above the porch. It was a chapel-of-ease to Bradwell in the Middle Ages, but was eventually desecrated and used as a barn; the apse and tower were destroyed. It has recently been restored and is now again used as a chapel. The building is of extreme interest as one of the earliest surviving churches in England." This church is built almost entirely of reused Roman material, including ashlar, brick, and nodules of hardened clay, and has the lofty character typical of the period. There are indications in the masonry of the east wall that the original communication between the nave and apse was by three arches, as at Reculver. All the windows are placed at a great height above the floor, and retain much of their original work. The Commission describes the condition of the building as "Good." Another building of exceptional interest is the tower of the church at Corringham, dating from the latter part of the eleventh century. This is a bold square structure without buttresses, and consists of a lofty lower stage, quite plain except for small loop lights, and two low upper stages relieved by blind arcades and small belfry windows. It has a pyramidal roof.

Since the absence of freestone within the county itself rendered stone a relatively expensive material, there has been always in Essex an extensive use of brick and timber. The result is that the county contains some very charming buildings constructed of these materials. Little Warley Hall, in the parish of Little Warley, is an agreeable example of brickwork of the early part of the sixteenth century, with a corbie-stepped gable and a projecting chimney decorated with diaper work. Of the wealth of timber houses in this part of the county described and illustrated Great Sir Hughes, in the parish of Great Baddow, is a conspicuous example. It was built in the first part of the seventeenth century in the early Renaissance manner. The county generally is rich in examples of good timber belfries, and a large number of them is contained in the south-east division. That at Stock, rising from the centre of a timber narthex, is a fine example. A photograph of the Renaissance gateway of Tilbury Fort, built about 1682, is chosen for the frontispiece to the volume. This is a stone structure of two stages, the lower of the Ionic Order with two columns on either side of the gateway, and the upper of the Corinthian Order surmounted by a segmental pediment containing the royal Stuart arms and flanked by carvings of war trophies.

In the inventory of the several parishes the churches with their fittings, the secular buildings, and the earthworks are examined in succession. Most of the churches of prominent importance are illustrated by hatched plans, and all the ancient churches are accompanied with key-plans drawn to a uniform scale. This arrangement, while it materially increases the value of the work as a record, greatly assists the reader's comprehension of the text. It is obviously impossible to treat the secular buildings, even of the larger houses, on so liberal a scale. During the course of their existence the advance of civilisation and the change of customs and aspirations of their owners have resulted in additions, alterations and even destruction of parts of them to an extent that in some cases the original disposition is unrecognisable. We understand that for this reason the few plans of houses given in this volume are not lettered as to disposition of parts. Where this can be done, however, it would greatly assist the comprehension of the text, which we find in the long descriptions none too lucid. We venture to suggest that a greater freedom in the accounts of the larger houses would give a more definite conception of them. The result would be a more useful and valuable inventory.

The photographic illustrations are profuse throughout the volume and attain a high order of merit. Many of these are full page or half-page illustrations, while others are grouped together on plates and arranged in series illustrative of church towers, timber belfries, timber houses, &c., or of church furniture, painted glass, church plate, and similar details. Two pages of mouldings with their dates and the names of the churches in which they are to be found are appended. Another welcome item is the inclusion in this volume of an armorial of the county families of Essex before 1550.

The general survey of the whole county, in which each especial subject is written by an eminent expert, is a most valuable part of the report. Particularly interesting to architects is the section under the sub-heading, "Architecture: Comparative Review." The results of the investigation under this section are here summarised and the characteristics of construction and embellishment distinguishing the various periods described. Various types found throughout the county are analysed and compared with each other and with examples existing elsewhere. Note is also made of the materials and other influences which directed the course of architectural development in the county.

Having regard to the value of the work of the Commission, a value as much practical as historical, it is to be regretted that the Treasury refuses to entertain proposals for its adequate development or to provide sufficient means for its operations, for the present, beyond the counties of London and Middlesex. These volumes provide, in an attractive form, that intimate and intelligent knowledge of England's priceless possessions which cannot but result in an incitement to the development of art on national lines, and *pari passu* to an encouragement of industry. We trust, therefore, that the Treasury will see its way to revise its policy in this respect. The value of these volumes to the architectural profession is considerable. It is not without reason that architecture has developed on national and even on local lines. The influences of climate and available materials and of customs and temperament have impressed themselves upon our predecessors. Their works are often the result of improvements step by step as they have developed under the conditions imposed upon them. Therefore, all who are responsible for the restoration of old or the erection of new buildings in a particular neighbourhood should familiarise themselves with local traditions, and to this end we know of no better complement to personal acquaintance with the locality than one of these volumes.

THE LIGHTING OF PICTURE GALLERIES.

By G. MAXWELL AYLWIN.

So much has been written about the correct lighting of picture galleries that very little can be added to the devoted thought that has been expended upon this very interesting and important subject. The excuse for again touching upon it at all must be that the prominence recently given to this branch of architectural design may make it desirable to give access, for the benefit of those interested, to a concise summary of some of the most important results of others' study. Such an authority as Mr. Hurst Seager, F.R.I.B.A., leaves little for the casual student to add, but rather provides enough, and still more from which to build. His exhaustive works upon the subject of "Top-side Lighting," for which system he makes out a convincing case, are such that the student thereof can hardly fail to be at any rate much influenced by his views.

The design of art galleries depends upon many factors of which that of correct lighting is only one, though one of vital importance. The particular requirements of each individual problem, easy circulation on plan, dignified expression in elevation, the effect of a quiet setting in interior treatment, and the eternal bugbear of cost, must each and all make an imprint upon the complete conception. Yet a little reflection must show that correct lighting, even when considered as a separate factor, is also dependent upon each of the others, and no other factor can be deemed to be adequately satisfied unless contributing to the all important lighting. For instance, the most correct section of a single gallery may have its benefits entirely neutralised by the unwise grouping of surrounding buildings. Actually it has been found that the converse also holds good, viz., that an incorrect section may, on occasion, be corrected by the accident of surroundings. Mr. Seager particularly refers to the Soane Museum, where, in one instance, a room top-lit by a pitch-roof skylight becomes a perfectly lighted gallery owing to the fact that one slope receives the direct light from the sky while the other is muffled by the reflected light from a high dull brick wall. The spectator stands in shade, and the whole effect is that of a perfectly lighted gallery, the principal picture (glazed) being entirely free from reflections and seen to perfect advantage, as Londoners will probably remember, though perhaps without considering the cause.

The picture lover is well acquainted with the difficulties and strain experienced during a protracted visit to our best known art galleries. Some pictures are almost entirely obliterated, while others—and the majority—are much confused. Just one here and there is seen to perfect advantage as the result of a happy sequence of accidents. It is, of course, the glazed pictures, and, of these, those that have the largest and darkest grounds, that suffer the most. Such pictures become mirrors eager to catch and reflect all the light they can reach. They must, therefore, be given a peculiar function, in that they must be themselves well fed with light, which must, however, be reflected out of the range of vision of the spectator as far as possible. Such reflections as are inevitable must be so subdued in tone as to subordinate themselves to the picture beneath the glass. The actual original source of light will, of course, throw the most brilliant, and consequently most disturbing, reflection in the glass of the picture. It is a comparatively simple matter to design the gallery so that the source of light is reflected out of harm's way, and a very elementary knowledge of the laws of reflection will suffice.

From an early date in the history of art galleries this was a primary consideration which was well recognised, and few of our art galleries fail in this respect. The National Portrait Gallery affords one or two instances where this is not the case and with disastrous results. Even where this elementary law is maintained it will be found that in most picture galleries the majority of the pictures are full of reflections—perhaps most annoying of all that of the spectator himself dominating whatever picture he is most anxious to appreciate. The brightest reflections are those of the most brightly illuminated objects.

The old top-lighted system naturally illuminates the whole room first and the pictures next, so that the reflections overpower the picture, and the system has therefore been condemned by many authorities, of whom Mr. Seager is the best known. The late Mr. C. C. Brewer was equally emphatic upon the subject in his report upon the American Museum Buildings in 1913. Mr. Benjamin Gilman also rejected the top-lighted system, preferring attic lighting, *i.e*, windows in the side walls close to the ceiling.

Various modifications of the top lighting system have been tried with good or bad effect. In some cases the central portion of the flat top light has been blanked with the object of shading the spectator and of concentrating the light near the pictures. The result has been in effect the direct opposite of the intention, as the near spectator receives a concentrated illumination which serves merely to accentuate his reflection. Another method was to form a top light of three surfaces, in section like a truncated triangle, the flat central portion being blanked, the side slopes only being glazed to throw a direct light on the picture. Some such system has been adopted at the Wallace collection, where the result is hardly a success. The pictures are certainly well illuminated, but the sloping light above the picture tends to over-illuminate the front of the spectator, though proportionately less than in the case of the flat top light near the walls. Yet another improved method is to be found in the later rooms at the National Gallery, where the roof, designed much as in the last described method, springs not direct from the side walls but from deep coves, which arrangement brings the springing some feet out in advance of the walls. The result is not completely successful, as the light upon the pictures strikes also the back of the spectator, defining an illuminated halo round his dark form with confusing effect. It is, however, impossible to pass from the old full-blooded top-lighted galleries into these later and improved ones without becoming conscious of a relatively restful effect. There can be little doubt that a distinct advance was made when this system was adopted, after much scientific research under the direction of the Office of Works.

To summarise the requirements of a well-lighted gallery, from observations which will be apparent to every student of perception, we find:—

(1) That the source of light must be reflected out of the range of vision of the spectator.

(2) That the picture must receive ample direct light.

(3) That the spectator must stand in a relatively subdued light.

(4) That the spectator must not intercept any light passing from the source towards the picture.

This brings us to the subject of the top-side light system as advocated by Mr. Seager, and which appears to satisfy all the above requirements. In this system the spectator passes down a central corridor which receives no direct light and is covered with a flat ceiling. From this are opened up a series of side bays roofed with pitch roofs parallel with the central corridor, the slope next the corridor being glazed to throw a direct light on the back wall of the bay. The pictures are hung on the back walls, and, to a limited extent, upon the side divisional screens. (Mr. Seager advises within six or seven feet from the inner edge.) Seats are provided just inside the bays off the corridor, but not sufficiently forward to catch the light from above. The result is a good direct light on the picture with the source hidden and *in front* of the spectator.

The Ryks Museum at Amsterdam seems to indicate an early attempt in this direction. The central corridor is vaulted, and the opening to the bays are heavily curtained, but injudiciously lighted from the top, and reflections are not eliminated. The effect in the corridor is also very gloomy and unsatisfactory.

Probably the most complete example of an existing art gallery on the top-side light system is the comparatively recent Sargeant Art Gallery at Wanganui, New Zealand, in the competition for which Mr. Seager himself acted as assessor. The assessor's report is published and on sale to the public, and is a very instructive document to read. It is of interest to see that in the assessment of the preliminary competition in the Wanganui competition the assessor awards only 30 marks out of a possible 168 for lighting. This seems to suggest that, in any similar competition, while the lighting of the premiated designs might be considered unsatisfactory, the assessor might feel justified by the relative excellence in other directions in so awarding the premiums as apparently to ignore the lighting arrangements. Yet, as has been seen, the lighting factor is indivisibly bound up in many others. The top-side light

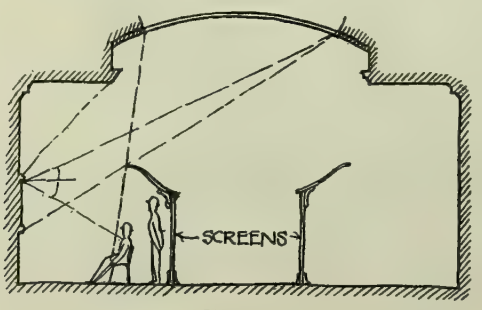

FIG. 1.

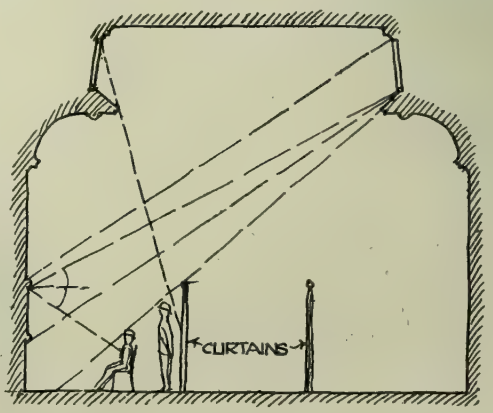

FIG. 2.

Lighting of Picture Galleries.

method to some extent imposes a certain type of plan, and in awarding marks for a plan of that type an assessor is also, in a way, giving votes for a particular system of lighting. The same applies to the interior treatment.

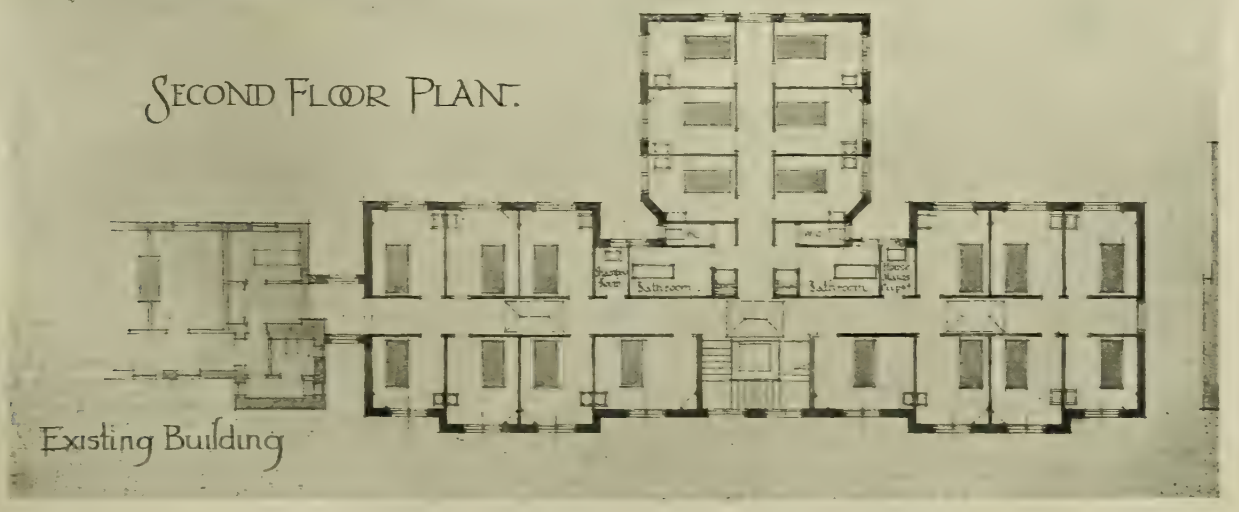
It is well to remember that the study of one particular branch of design is apt to develop a bias and to exaggerate in the mind of the student the relative importance of the branch in question. It might be urged, with some justice, that the top-side lighting method does tend to eliminate an air of architectural spaciousness, and that it does tend to add to first cost by multiplying internal supports and eliminating large open spaces. These considerations must weigh very heavily in the mind of an assessor if he is of opinion that correct lighting can be obtained in any other way.

One possible method of modifying top light may be suggested. Light, low screens, designed as furnishings in some dull-toned material, might be arranged in front of the pictures at such a distance as to allow of seats between screen and picture, at the correct viewing distance, and with a narrow walking space behind the seats, and forming a continuous corridor down the centre of the gallery. The top of the screens would be designed to overhang towards the pictures, somewhat after the arrangement of a gantry-fan, in order to throw the spectator into shadow. The screens would be frequently broken to allow of ready access between the corridor and the viewing space, and where such gaps occurred a judicious choice of pictures to hang would be necessary, such as the unglazed, and those of a light ground and the least susceptible to reflection. Such an arrangement would seem to meet most of the requirements of correct lighting, while maintaining the air of spaciousness in the gallery, and the screened-off viewing-space would induce that intimate atmosphere which seems desirable for the happy enjoyment of good art. The reflections from the brightly illuminated wall opposite would be entirely intercepted, and the spectator himself would be standing in the most subdued shade, and it is believed that the result would be entirely satisfactory. The suggestion is roughly illustrated by the sketch section (fig. 1). Similar steps might with advantage be taken to improve the lighting effects in such places as the later rooms at the National Gallery before referred to. In this case the screens would need no "fan" at the top, as the cove of the ceiling would (or could be made to) shield the viewing space from top light. They might well take the form of a series of sombre curtains, the neutral folds of which should form an admirable medium for inducing shade (fig. 2). Mr. Seager himself hints at some such subterfuge for correcting the gallery at the Tate, in which the largest Watts picture presents such a problem to those who would study it as a whole, rather than a square foot at a time. He suggests the hanging of a curtain down the centre of the room to eradicate the impossible reflections.

Means such as these seem to be applicable to almost any existing or intended systems of top-lighting, except where there are flat top-lights near the wall. Mr. Seager suggests that existing top-lighted galleries might be rendered tolerable by shutting off the light one side at a time by means of opaque blinds, thus alternately displaying one side or the other in correct top-side light. This appears to be an admirable half-measure, though it does not eliminate the "halo" round the spectator, and it has the disadvantage that visitors from a distance may be disappointed to find that the particular picture for which they came specially to see is not on view, as those on the darkened sides would be quite invisible owing to reflections worse than the normal.

Beyond these first considerations there are others of importance in designing the best setting for the display of fine pictures. Mr. Seager refers to most of these in his papers. It is essential to avoid highly coloured walls which tend to cast their tones upon the whole of the pictures displayed and entirely alter the colour values. A darkish neutral tint would seem the wisest choice, and with a rough stippled surface. The floor covering, if of a light reflecting nature, throws a most irritating reflection upon the lower part of pictures on the line. Light polished oak is particularly bad in this respect. Some darkish matt surface, such as dull black and grey rubber paving, should do well, and would also serve to maintain silence in the gallery.

Finally, a perfectly designed gallery should be arranged so that no picture is exposed opposite the doorway leading to another well-lighted gallery, or the clear-cut reflection of the latter will be obtrusively displayed in the glass of such an unfortunate picture, as to render it quite indiscernible. A little judicious screening will correct such an arrangement.



As has been previously pointed out, these notes are mainly intended as a resumé of the results of others' faithful study and research, supplemented by a little personal observation and thought. They seem to indicate that the top-side light system, as advocated by Mr. Seager, is the ideal at which to aim in the setting for pictures, and that the majority of our galleries at present violate nearly all the first principles of correct lighting. They do not, perhaps, present a complete answer to those who feel the loss of a certain amount of architectural effect, or who are a little nervous of mounting cost. Some will also say that a gallery so designed to house adequately a collection of pictures may soon become overcrowded, tempting the authorities to utilise all the wall space of the side-screens to the bays, thus leading the public right into the bays, to the confusion of all original intentions.

In conclusion, a final general appreciation of those members of the profession who, like Mr. Seager, have devoted their life efforts to the solution of scientific problems in which the rank and file find themselves sadly out of their depth if unaided. We are a little apt to look askance at science as a rather cold companion, but we greet her thankfully after academism has failed us, and the more thankfully when we find her within the sympathetic bounds of the profession.

ROME SCHOLARSHIP IN ARCHITECTURE.

In reference to the preliminary competition for this scholarship, a critique of which we gave in the last issue of *The Builder*, the following is a complete list of the students who competed. Those starred were the selected for the final competition. It will be noticed that seven of the successful students are from Liverpool University,

*Charles T. Bloodworth (University of Liverpool).
Richard W. Briggs (University of Manchester).
Leo Durnin (School of Architecture, Aberdeen).
A. Muriel Hargroves (University of London).
Frances T. Silcock (University of Liverpool).
Alexander M. Stewart (School of Architecture, Aberdeen).
*Donald Brooke (University of Liverpool).
*D. L. Bridgwater (University of Liverpool).
*Francis X. Velarde (University of Liverpool).
*John H. L. Owen (University of Liverpool).
*Hubert S. Silcock (University of Liverpool).
*Marshall A. Sisson (University of London).
*Herbert Thearle (University of Liverpool).
Leonard C. Howitt (University of Liverpool).
*Elsie Rogers (University of Manchester).
Fred E. Towndrow (University of London).

Additional Sleeping Accommodation at St. Marylebone Hospital.

THE SHEFFIELD SOCIETY OF ARCHITECTS AND SURVEYORS.

THE GUILDHALL, LONDON.

On February 21 Mr. Sydney Perks lectured before this Society on "The Guildhall, London." In the course of his remarks he said it would be no idle boast to claim that the Guildhall was a unique building, for although it was formerly the scene of historical events of greater importance than to-day, it was still the centre of great civic movements, and its usefulness had increased in many ways. It might be said that Westminster Hall had a history to rival it, but Westminster had lost even its courts of law, and lived almost as a monument of the past; whereas the work and importance of the Guildhall increased from day to day. Little was known of any Guildhall erected before the present building; there was a previous structure apparently with a frontage to Aldermanbury, and the lecturer had heard it suggested that the west portion of the existing crypt was part of that Guildhall. Maitland, in his book of "The History of London," wrote: "The Mayor and Court of Aldermen considering the many inconveniences arising from, and great obstructions given to, the public business of the City, which daily increased with inhabitants, occasioned by the want of room in that despicable Cottage, the Guildhall in Aldermanbury, set about erecting the present Guildhall, which is a spacious structure, well accommodated for the transacting of all Publick Affairs belonging to the City." This extract was certainly in keeping with the idea that the old Guildhall had a frontage in Aldermanbury, and that the present building was erected independent of the old structure. The old views of the exterior showed that the appearance was roughly similar to its appearance to-day. After the Great Fire Wren added a story and provided the hall with a flat ceiling, and there were many views, both of the interior and exterior, showing the appearance of the building until the present open roof was built by Sir Horace Jones in 1864. He followed, as far as possible, old traditions, but in place of two small ventilators he fixed one large fleche. Although this was very effective from a distance, it was open to criticism in that it has the effect of somewhat dwarfing the appearance of the front from the Guildhall Yard.

With regard to the crypt, the eastern half, by far the most elaborate portion, varied very little from what it was nearly 500 years ago. The crypt had quite recently been restored; until then the walls and vaulting were covered with dirt and grease, the shafts supporting the vaulting were quite black, and it was only after the removal of the grease and dirt that the colour of the blue Purbeck stone shafts could be seen. This eastern crypt was more expensively constructed than the western portion; it was probably used for certain meetings, and its importance was emphasised by the fine entrance, which was quite as elaborate as the fifteenth-century porch. It was often suggested that the cross wall, which divided the crypt in two parts, was not built at the same time as the vaulting constructed in one of the two halves. This had been used as an argument by those who had advocated the theory that a part of the crypt formerly belonged to a previous building. The western half of the crypt was supposed to have collapsed during the Great Fire, and Wren was credited with the restoration. This theory was no doubt correct. The architect, whoever he was, proceeded to rebuild the vaulting necessary to support the floor of the hall. He did it in the quickest way possible; he did not replace the old stone vaulting, but simply built a brick wall at each end of the space to be covered, and just inside the old stone walls, one being the cross wall and the other the west external wall, and in doing so he built up all the old stone responds, and they had been hidden from 1666 until a few weeks ago. Wren built a series of brick arches, similar to a range of railway arches. He filled up the haunches and replaced the floor. The workmen filled in with any stone or brick debris handy, and hundreds of beautiful Gothic fragments existed to-day in these brick walls. While removing the brickwork to uncover the Gothic work a very large number of the fragments had been carefully removed and labelled, and were ready for depositing in the museum. Of course it was a great pity the Gothic work was bricked up, but in a certain sense it was to their advantage to-day now that these links with the past had been brought to light, for the bricking-up process had preserved the stone and also the ironwork of the windows; the work was now exposed after a lapse of 240 years.

With regard to the western half of the crypt; from the time of the Great Fire onwards this portion of the building had not been treated with the kindness it had a right to expect. It was always evident, from the responds along the side wall, that this portion of the crypt was vaulted. There was a very interesting staircase from the crypt to the side of the porch, which was almost entire. The entrance at the crypt level still had stout hooks, and the ceiling was simply vaulted by stones leaning against one another; a straight joint running from end to end. The whole of the western half of the crypt was constructed in a much less expensive manner than the eastern half. The windows had simpler heads, and were not glazed—glass was a luxury in those days; the piers of the vaulting were in ordinary stone, and not Purbeck, as in the eastern half, and there were no caps. A possible reason for the difference was that the eastern half was constructed for ceremonial purposes, and the western half for muniment purposes or domestic work. This might or might not be so, but the lecturer advanced the theory as a practical solution of a difficulty. Later on the western end of the crypt was used for stables, for they read in 1683 that two Aldermen were requested to report upon the "mischiefs arising from the keeping of a stable and a coach-house under the Guildhall." The vaulting in the western half of the crypt was not planned conveniently for the main shafts above; in other words, the responds for the vaulting were not under the piers in the hall, but along each side wall there were other responds which were immediately under the piers of the great hall. It had been suggested that this part of the crypt, being a portion of an earlier building, was retained when the great hall was erected; consequently it was necessary to add responds to support the piers above, cutting through the vaulting of an earlier date. That theory was, he thought, incorrect. It was quite clear that the wall rib of the vaulting and a portion of the additional pier adjoining had been cut out of one stone; in fact, the vaulting and all responds were built at the same time.

The lecturer then dealt with what could be seen to-day. The east end and two return sides on the hustings were pannelled in oak. This panelling was copied from a screen in Newark. Church, and he thought it a great mistake to destroy Montague's design in stone and erect a copy of work which, although excellent, was erected under entirely different conditions. Again, the proportions of the panels, &c., had been altered to make it fit in, and the effect was much inferior to the original screen at Newark, The woodwork had a heavy projecting canopy, and this was immediately under the stone canopy. The result was not only did the wood canopy prevent anyone near the east end from seeing the stonework above, but they got two heavy horizontal lines immediately under the window, which had the unpleasant effect of dwarfing the end of the hall. It was apparent to the most casual observer that the woodwork formed no part of the original design, for they saw one canopy immediately under another, a senseless arrangement very detrimental to the dignity of the hall. At present the space at the back of the panelling was a receptacle for an enormous amount of dirt and dust, which could not be cleared away without taking down the screen. Last autumn the lecturer had a small portion of the panelling removed and some hangings submitted to members of the City Lands Committee, and the result was favourably received. The work of restoring the porch to the Guildhall was now well in hand. The original porch, known as "The Guildhall Gate," was erected in 1425, and was very different from what they understood as an ordinary porch, for it was the full width of the Guildhall yard, about 63 ft. wide; it had two doorways in it, and was in part certainly three stories high. The original porch, with Wren's alterations, was pulled down in 1788, a fact which was ever to be regretted.

Until recently almost the entire wall surface of the Guildhall was covered with a preparation of cement about one-sixteenth of an inch thick. This had been painted and distempered, with the result that the sharpness of the mouldings had disappeared, and it was very difficult to distinguish between the original Gothic and the imitation work which had been carried out from time to time. This plaster and paint work was said to have been started in Wren's time, the object being to paint the new stone used in restoration work after the Fire, and also the stone blackened by the flames, so that the whole should have what was considered a pleasing and uniform appearance.

Considerable interest was taken recently in the discovery of the one and only original and complete window in the great hall. It had been stated that the discovery was accidental, but there was nothing in the slightest degree accidental about it. The hall had just been cleaned, and it was possible to distinguish between old stone, new stone and cement with the greatest ease. The window in question was next to a bay, which had a blind arcade into which a bronze memorial had been fitted. The bay, at the back of which existed the window, presented an almost identical appearance; the centre portion was divided into three parts, but there was this difference, the mullions of the bay in front of the old window were of cement and those of the bay containing the statuary were of stone. With regard to the south window this had received further attention, and the brick wall on the outer side had been removed.

Cut-Throat Alley. — There was formerly a footway from the Guildhall-yard to Basinghall-street. In the fifteenth century the entrance was through the smaller gateway of the south front. Maitland states there were steps up from the alley into Guildhall-yard. It was clear that must have been so when they compared the level of the crypt doorway with the yard; the old views of the front showed one step up to the end of the porch, which was the same to-day as it was when first built, and the threshold of the crypt doorway also existed now. Cut-Throat-alley, no doubt, entered Basinghall-street through one of the footways shown on the old plans. As time went on it seemed that light was not considered of so much importance in the crypt, and the steps were found inconvenient. The Guildhall-yard to-day was 5 ft. above the level of the roadway in Basinghall-street, the descent of the steps was required to form a sinking in the ground, or continuous area to allow good light in the crypt. The necessity for ample light was also shown by the sloping of the soffits of the window recesses on the inner side of the wall of the crypt. It was clear that the descent of about sixteen steps down from the Guildhall-yard necessitated a rise of about 3 ft., or six steps, to Basinghall-street. Traffic, of course, increased, and no doubt the importance of the crypt decreased, for they knew that additional buildings were constructed. The result was what one might expect, the level of Cut-Throat-alley was raised and the sunk portion was filled in.

In conclusion, the lecturer stated the members of the Corporation took the greatest interest in the building, and in the opening up of old portions. The Committee dealing with the structure was known as the City Lands Committee, and was the premier committee of the Corporation.

Marylebone Hospital, Nurses' Home.

The drawings illustrated show an extension of the existing Nurses' Home at this Hospital, and the scheme was accepted in a limited competition.

In order that the building externally should conform as far as possible with the existing buildings, it will be faced in stock bricks with stone dressings. The windows will be in wood frames with iron casements. The building is designed on three floors and economy in design was the first consideration. As much natural light as possible has been introduced into the staircase and corridors.

Internally, the building will be finished in a simple manner, the floors covered with jointless flooring, walls plastered and distempered. In order to eliminate noise, the corridors will be covered with a rubber carpet. The staircase will be constructed in oak to give a more home-like effect than is obtained in a concrete or stone staircase.

The building will be constructed without internal structural walls, so as to avoid complications should it be desirable to use it for other purposes. The whole of the internal joinery is in pine. The corridors will be heated by radiators with low pressure hot water. Constant hot water will be provided to the bath-rooms and shampoo rooms on all floors.

The contract for the work has not yet been placed, but the estimated cost is approximately £12,800.

The architects are Messrs. H. Courtenay Constantine, F.R.I.B.A., and Austin Vernon, A.R.I.B.A., of 82, Mortimer-street, London, W.1.

Messrs. Woolworth's New Premises, Oxford-street, W.

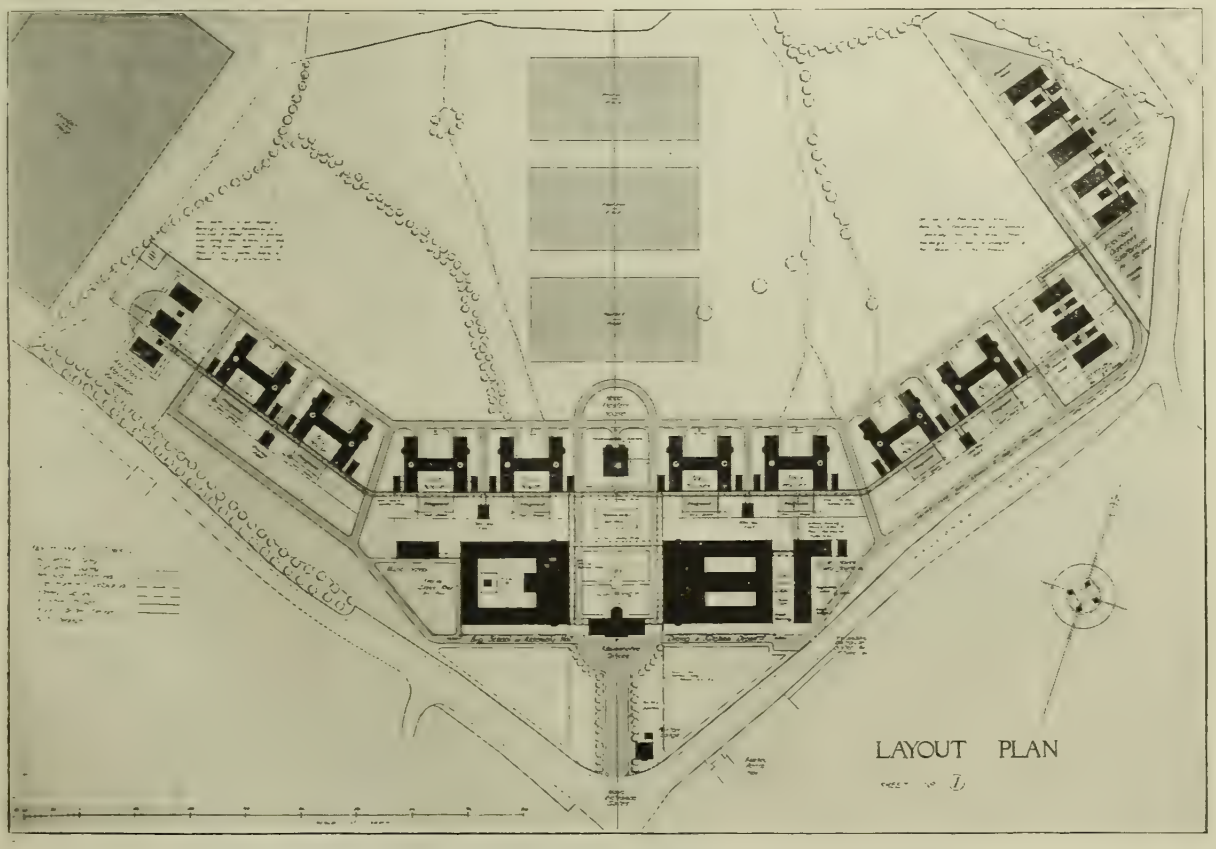
This new block of buildings is now in course of erection. Messrs. Woolworth's are carrying out their own building operations under the superintendence of their architect, Mr. Wm. Priddle. The front is of white glazed terra-cotta, supplied by the Shaw Glazed Brick Co., Darwin; and the steel work by Messrs. Banister Walton & Co., of Manchester.

Wandsworth Town Hall—Proposed New Buildings.

The present Town Hall is situate in High-street, Wandsworth, and in 1920 this road was widened considerably, the front of the Town Hall removed, the size of the Hall curtailed, and a temporary front erected to the new line of road.

The Wandsworth Borough Council owns land adjoining the present Town Hall on the east side, and it is upon this land that the new Town Hall is to be erected. It is proposed to remodel the old hall and adapt it so that if required it may be used *en suite* with the new hall by means of connecting lobbies. The temporary front of the old hall will be taken down and the design shown on the accompanying sketch is the proposed elevation combining the new front of the two halls. It will be a steel-framed building encased in brickwork and the elevations will be of brick and stonework, with metal casements to all windows.

The ground floor of the present building will consist of club rooms and small halls, with a large hall to accommodate about 420 persons, on the first floor. The new building will include municipal offices on the ground floor and a large hall to accommodate about 800 persons on the first floor. Each hall will have a stage and the usual appurtenances.



The interior decoration of the halls will be a high oak panelled dado, plastered panelled walls, and plastered panelled elliptical ceiling.

The designs are by Mr. Ernest J. Elford, the Borough Engineer.

Royal Masonic Institution Junior School for Boys.

We give this week one of the designs submitted in this competition, by Messrs. W. & T. R. Milburn, FF.R.I.B.A. The block plan shows the buildings have been planned about a main axis, which bisects the angle formed at the junction of London and Falconer-roads. The great quadrangle forms the central feature of the scheme with the big school, dining hall, administrative offices and headmaster's house grouped round it. The estimated cost was £239,653.

The design placed first, by Messrs. Davis & Emanuel and Henry C. Smart was given in our issue for February 22, and part of the design submitted by Messrs. Gotch & Saunders in our last issue.

WESTMINSTER ABBEY RE-EXAMINED.

By W. R. LETHABY.

Transept Front and Great Portals.

While reading Mr. Westlake's excellent and comprehensive new history of the Abbey, I have been drawn to look over notes which have accumulated since I tried, in "Westminster Abbey and the Kings' Craftsmen," 1906, to give an account of the way in which it was built and of the workmen engaged. Two sections of my last series in *The Builder* dealt with this same subject and I hope now to get some other observations recorded by way of addition and correction.

. . . . . .

North Transept Front.—This was the principal façade of the church as rebuilt by Henry III, and here—because it fell within the limits of the first work and from its position in regard to the Palace and the chief approach by King-street—were placed the chief portals. While mentioning King-street, I may recall that it was only recently destroyed in widening the south end of Whitehall well within "my time."

The transept front was, I have no doubt, pushed on with the earliest work undertaken—that is, it was begun in 1245. The king would have been specially interested in these splendid doorways. As will be explained, they show close study of the portals of Amiens Cathedral, and the first master mason evidently knew that great work as well as Reims and the Ste. Chapelle. This master was Henry de Reyns (see *The Builder*, September, 1923).

From what is known of it, and as an important work built in the middle of the thirteenth century by the connoisseur king, this front may be regarded as the supreme example of our mediæval art. A student who would make a trustworthy drawing of the front by carefully bringing together all the evidence that can be gathered with the least possible amount of conjecture, would make a valuable contribution to the history of English art.

In 1906 I sought to show, by an examination of old prints and other evidence, what the main details of the north front were like before it was partly recased in Wren's time, and again almost totally recased at the end of the nineteenth century. The conclusion was arrived at that the north transept end, with its great sculptured portals, was modelled on the west front of Amiens Cathedral, which could hardly have been completed when the Abbey was begun; the central doorway contained a sculptured tympanum representing the Doom, and there were large statues of the Apostles in the jambs below. The windows in the recesses above the lateral porches were originally of the form in which they remained when I drew them in 1875; the forms of the original tracery filling the transept gable had also been preserved when I drew it at the same time; the form of the rose window might be established by a comparison of authorities; a passage-way arcade below it had eight pairs of openings distributed in the side and central compartments thus | 2 | 4 | 2 |, and not as in the "restored" front thus | 3 | 5 | 3 |.

The authorities were gone over again in the Journal of the R.I.B.A. in 1920, and several of the prints referred to were reproduced in a form useful for reference. The conclusions which I had freely arrived at in 1906, without preconceptions, but merely by an examination of the evidence, were here contradicted. It must, however, be recorded that I remain of the same opinion still. It is dreary work arguing again over conclusions which are denied, but new evidence is provided by a representation of the north front of the Abbey on a seal of Westminster School, which, I believe, was unknown in 1906; at least, I did not know it. This seal, dated 1661—the year following the Restoration of Charles II—is an amazingly delicate piece of work, engraved by Simon, who was, probably, the most remarkable English artist working in the Commonwealth period. Thomas Simon was chief graver to the Mint, and he walked at the funeral of Oliver Cromwell with the master carpenter, master joiner, master carver, and master mason, Mr. Philips. (No architect!)

The view of the Abbey given on the seal is of more value, as it is in elevation and nothing is hidden by projecting buttresses. It shows the later porch, which was erected against the central portal late in the fourteenth century, as still existing. It was pierced with such large openings that it must have been quite a glass-house. The gables of the side porches appear, also the circles in their tympana, and sculpture seems to be indicated in these. Large sculptured figures are on the buttresses, and on each side of the lateral windows. There are shields in the spandrils of the arches over these windows, and of the arches ranging with them in the central bay. The wall arcade between these arches and the rose window has four pairs of openings in the central space and two at the sides | 2 | 4 | 2 | as before described (Fig. 1).

Fig. 1.—Seal Enlarged.

This part is very clearly rendered; there were cinquefoils in a circle above the pairs of openings. The seal impression is injured at the rose, but enough remains to indicate the general character of the tracery and the pierced spandrils. Because of the small scale only about half the number of divisions were given in the tracery.

I give a general rendering of what I suppose it was like in Fig. 2, which may be compared

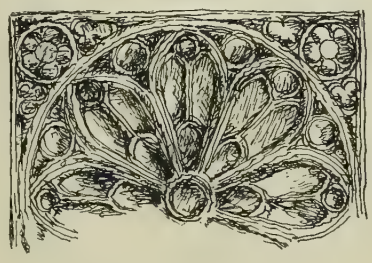

Fig. 2.—Seal Restored.

with the results reached before. The difference between the triforium windows to the east and to the west of the transept is accurately indicated on the seal. The main gable of the transept was obliterated.

We know that the tracery filling this gable had three circles containing cinquefoils above a blank arcade; two of the circles were pierced as windows, but the central upper one was blank. It must, I think, have contained a figure of the Majesty. Such gable figures existed at Wells, Lincoln, Salisbury, Crowland and Lichfield. The actual figure from the gable at Crowland is the battered image now at the triangular bridge, and usually called St. Ethelbert. The gable figure from Lichfield is, I believe, at the village of Stoke (?), not far away from the city. The blank arcade beneath the three circles was probably intended for standing figures, possibly the orders of angels as at Wells.

Great Portals.—In my former study of the north front I pointed out that its design was based on the noble west front of Amiens Cathedral, and I gave a diagram of the scheme of the latter. I have now re-examined the evidence, and there cannot be a doubt of the facts, as even the sketch plan of the Amiens porches is sufficient to show (Fig. 3). The influence of the

Fig. 3.—Amiens.

west front of Amiens on the north front of Westminster is so marked that it becomes highly probable that the sculptures of the portals were also similar, and that the Last Judgment was the subject assigned to the central porch at Westminster.

This supposition is confirmed by the fact that the jamb statues at Amiens were of the Apostles, and there is a record that at Westminster there were statues of the Apostles of full size by the central door.

The magnificent south porch at Lincoln, part of a work just subsequent to Westminster, and obviously inspired by it, is sculptured with the Last Judgment. Christ appears in a quatrefoil, together with cross- and spear-bearing angels in the upper part of the tympanum, and the rising dead were below. (The slightly later west porch at Lichfield follows the same type.) The little figure sculptures and open-work foliage in the arch-orders are so like those of the Chapter House at Westminster that a close relation between the two works at Westminster and Lincoln is obvious.

The drawings and engravings of the central porch at Westminster show a large quatrefoil in the tympanum, and Scott found evidence for it and followed it in his "restoration"

At Amiens the top of the central tympanum is occupied by Christ on a throne with hands upraised exhibiting His wounds. On each hand is the Virgin and St. John; also, on one side, an angel bearing the cross; and on the other an angel with the spear and nails. Above is a group of angels carrying sun, moon, &c. Below is the separation of the just and unjust—a yawning beast's head represents the jaws of Hell. Still lower, little bare bodies scramble out of long box-like tombs; while angels blow trumpets. Around the arch-orders are a crowd of lovely worshipping angels. On the central pier of the doorway is a standing figure of the teaching Christ; the side door-posts have *bas reliefs* of the wise and foolish Virgins. To right and left, on the deep splayed jambs, are the Apostles, supported on corbels projecting from the jamb columns. The lower part of this jamb is covered by a series of reliefs in medallions, arranged so as to touch one another like rows of coins. On the slanting jambs small shafts are placed between the larger ones, which bear the statues. Over the larger shafts are sculptured arch-orders, while over the lesser shafts they are moulded. This alternation of arch-orders is followed at Westminster and at Lincoln. Some statue corbels which remain at Westminster are at a similar height to those at Amiens, and it may not be doubted that some of the standing figures at Westminster were set against the jamb columns. The jamb figures at Lichfield are placed in this way. The medallions just mentioned at Amiens were followed in the filling of the tympana of the lateral porches at Westminster (Fig. 4). Again, at Amiens, the door jambs were enriched by square diapering of a type which is found on the door to the Cloister at Westminster, and it doubtless existed at the north porches as well.

It seems probable that the right-hand lateral porch at Westminster, like that at Amiens, would be devoted to the Virgin. The keystone of the vault of the recess, which is one of the very few original external stones which remain, is carved with an angel which had outstretched arms, and hands which probably held a crown. This would be especially appropriate above some sculptures of the life of the Virgin. The bosses of the vault of the aisle *within* this door

are of figure sculpture, differing in this respect from others which are of foliage, and these sculptures, David with his harp, the Coronation of the Virgin, &c., seem specially appropriate to this position. So, again, do the carvings in

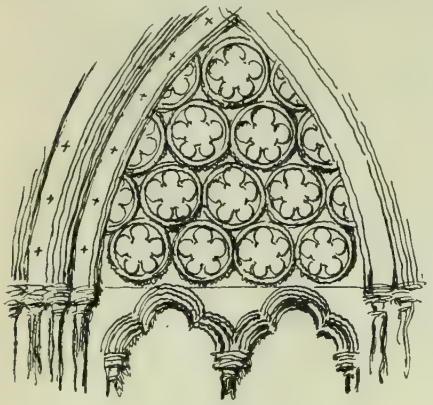

Fig. 4.—Eastern Recess in 1818: × × Sculpture Cut Away.

the spandrels of the wall arcade—a palm branch, St. Margaret the Virgin, &c. Further, there is a record that in 1644 and 1645, when the Abbey suffered from the process called "cleansing out pictures," that one, Thomas Stevens, was paid "for cutting out a crucifix at the north end of the Abbey" (May, 1644); and Thomas Gastaway was paid £3 3s. "for work done on the outside of the north side of Westminster, including the hire of scaffolding for taking down statues of the Virgin Mary and other saints" (May 13, 1645). At Amiens, the left-hand lateral doorway is devoted to the story of the local saint, and at Westminster the sculptures in this position *may* have referred to St. Peter and the Confessor, but of this there is no other evidence.

That the central portal contained the Majesty in quatrefoil on the tympanum, with cross- and spear-bearing angels on either hand, and others with trumpets, and the rising dead below, is as certain as circumstantial evidence can make it. Scott's original drawings for restoring these porches are in the Print Room at the Victoria

Fig. 5.—Central Porch.

and Albert Museum. He proposed from the first to put a quaterfoil in the tympanum, but it was comparatively small and had a major, vertical axis. When the work was begun and Wren's casing of the tympanum was stripped off, evidence for the position, form and size of the original panel was found. (My authority for this is some paper by the late Mr. John O. Scott, to which I have mislaid the reference).

The panel containing the Majesty as executed is of great size, and the form is that of a quatrefoil with square angles projecting between the curves. Now, in the little church of East Bedfont, Middlesex, there is a remarkable wall painting of "The Doom," which may be dated about 1260-70.

On September 15, 1923, I made a pilgrimage to examine this painting, of which good copies are preserved in the Victoria and Albert Museum. There are two paintings in recesses which adjoin at the north-west angle of the chancel arch; the Doom is in the northern recess and the Crucifixion in the eastern. The paintings are in the form of the tympanum of an arch about 4 ft. wide and as much in height. They are of fine style, simply executed in red, grey and white, the background red, and they must be the work of a London or Westminster painter. The Doom picture has a solemn figure of Christ seated in a large panel of exactly the form of Scott's panel at Westminster; He throws up His hands to expose the wounds, which also appear on the feet and side. In the lateral lobes of the quatrefoil are angels, the one on Christ's right supports the Cross and the opposite one holds the spear and a nail. Directly below the quatrefoil are three or four small figures pushing up the long covering slabs of their graves, while right and left in the lower corners of the arch-form are larger figures of two angels blowing trumpets. This remarkable painting, it would appear, must be based on the design of what, when it was painted, was the most splendid new sculpture of the Doom in the portal of Westminster Abbey.

Again, there is another strange piece of constructive evidence. Stone church, in Kent, has long been acknowledged to resemble the work at the Abbey very closely, and Street thought the details were even superior at the village church Now on the south side of the church is built in a beautiful early piece of sculpture of V form representing small figures pushing away the lids of their long, box-like coffins. Street, who illustrated it, in his little book on the church, describes it as: "A spandrel of an arcade, sculptured with a portion of the Resurrection of the Dead. It very nearly fits the spandrel of the arcade discovered in the south wall, and in order that it may be preserved I have had it placed there. The treatment of the bodies coming out of the coffins is good and the work is about the date of the church." Again of the fragments actually found in the south wall he writes: "A portion of an arcade; this seems never to have been completed, for whilst the lower stone has the dog-tooth enrichment of the arch finished, the upper stone has it simply blocked out. . . . We found a corresponding fragment of arcading built into the upper part of the chancel wall. . . . The conclusion at which I arrived is that these are fragments abandoned at the very time the work was going on."

I believe that the sculpture is part of the middle spandrel of a tympanum sculptured with the Doom copied from the Westminster doorway, and I hope to be able to work this out more fully after another visit.

Mr. Westlake, in his big new history of the Abbey, mentions Master Ralph of Dartford, mason, who was living at Westminster in the time of Henry III, and suggests that he may have been the master of the Lady Chapel begun in 1220. Stone is close to Dartford, and it seems possible that the link between the village church and the great Abbey was this Master Ralph.

Mr. Westlake is now kind enough to give me the full reference. It is the lease of a house "opposite the Almonry near the messuage of Master Ralph de Derteford cementarius." The date is that of Abbot Richard [de Berkyng], *i.e.*, 1222–46. (Westminster Abbey Muniments, 17342.)

The following notes from Mr. John O. Scott's report in 1880 on the work to the porches is worth reprinting: "Very careful investigations were made in 1871 and these led to the discovery of much of the antient design, including portions of the *stone roofs* or gables over the portals, also of the long *stone splays* below the transept windows [*i.e.*, the slopes] against which the gables abut. . . . The antient stone being much decayed could not be wholly retained, but some portions are still performing their office as they did 600 years ago. . . . Nearly the whole of the *mouldings*, except those on the acutal face of the gables, have been traced more or less completely, together with the *foliage* and *sculptured* orders of the arches—not the actual carving, indeed, but its position and size and heights of its main divisions, as also the mode in which *marble* was introduced." The italics are mine, the reference to sculptured orders is especially valuable. I believe that the old porches were still untouched in 1875. In a letter of 1910 the late Mr. S. Weatherly told me that "there was a long interval between the measurements and my perspective [1878] and the work being carried out."

In a letter of September 2, 1907, Mr. C. R. Baker King gave me the following facts:—The sizes of the voussoirs of the arches were carefully followed; the carving in the arches had been cut away, making hollows; the abaci of caps were of Purbeck; the neckings of the capitals extended along the jamb splays [not so now, but so at Lincoln]; a considerable portion of the ancient stone slopes remain; the pitch of the gables was given by several which had the intersection of two slopes; the sunk panels in the tympana had all been pared down [the cinquefoils must, I think, have taken the place of sculptures].

Many years ago, in a special study of the Doom door, at Lincoln, I identified two most beautiful female figures on the jambs as impersonations of the Church and the Synagogue. These are much in the style of Westminster sculpture and I have little doubt that the Lincoln statues were imitated from some once at Westminster. Similar pairs of figures are found at Reims and Notre Dame, Paris. They were, M. le Duc says, specially set up in cities where many Jews resided. Again, at Lincoln, one of the sculptured arch orders has a series of the wise and foolish virgins. As we saw above, these figures are sculptured on the door jambs at Amiens, and it may not be doubted that what is found at Amiens and Lincoln was also at Westminster. A second arch-order at Lincoln has figures of kings and ladies, probably, I think, the royal saints of England, and their subject would have been specially appropriate at the Abbey. Comparison of Amiens, the painting at East Bedfont, &c., shows that the Christ at Lincoln (and at Westminster) raised his hands; this noble figure and the angels on either side have been unhappily restored.

The drawing of Wren's time indicates the general design of the tympanum of the Doom portal. It had a large quatrefoil at the top and sub-arches divided into tracery beneath, the tracery rising from level lintels. How the tracery sprang from the marble lintels is explained by a contemporary doorway in the cloister which opens to the Library stair. There are here little corbels wrought on the lintel from which the tracery of the tympanum springs; moreover, the tracery is filled with carving, although it is of foliage and not of figure work, as would have been the case at the Doom door. Putting together all we know, I suggest that Fig. 5 indicates the most probable arrangement of the tympanum. A is the Majesty with two angels; B B trumpeting angels; C C the rising dead; D hell-mouth, as at Lincoln (see also Amiens above). We have seen that Scott found evidence for sculptures in the arch-mouldings of the north doors. Cottingham had a scroll of foliage of finest style "completely undercut with lions and birds at intervals," and described as from "the Door of north aisle of Nave." Lions and pairs of birds are found not infrequently in early mediæval art as symbols of Fortitude and Concord. Keepe (1683) described the central porch as "adorned with several intaglio's, devices, and fretworks that helped to the beauty thereof."

It appears from a description of the transept front in "Hatton's New View of London," 1708, that the sculptured reliefs of the central porch must have been defaced before that time, although those of the lateral recesses remained. "The north end was adorned with the figures of the 12 Apostles and some others (as 8 more) to be seen higher, as big as the life and placed in Gothic niches, of which there remains 6 below and 4 above, besides a prodigious number of small figures carved in *relievo* within the east and west porticoes of 3 at this north end."

Some slight notes of mouldings and details were made by John Carter. A drawing of the eastern recess made in 1818, by Ambrose Poynter, was shown to me by his grandson (Fig. 4). Important drawings of Wren's time, companions to the elevation published in the *Building News* (October 26, 1888), were also in the possession of Mr. Lee. These were most valuable sources, and I am sorry to say that

I cannot tell where they are now. The scale of the work is not likely to be recognised without some dimensions; it is 14 ft. to the soffit of lintel of central doorway and 37 ft. to the vault of porch; the central arch is 35 ft. high; and the side arches over 25 ft. high, and it is 50 ft. to the socket of the central gable-cross.

When the repairs of Wr.n's time were done, older wooden doors were new cased. These were broken up and thrown aside in the more thorough restoration of later days. A considerable fragment of one which remained has recently been adapted as a door to the stair of the Octagonal Crypt. It has diagonal framing covered with plain boarding, and such doors are shown at the North Transept in one of the seventeenth-century views of the interior.

Colouring, &c.—This wonderful work would have been completed by the usual vesture of whitening, colour and gilding. Our modern way of setting up costly structures in friable stone entirely without surface protection is a modern heresy which I can only suppose rests on an unconfessed and, indeed, unrealised idea that decay is good for trade. The arcade and sculptures of the west front of Wells Cathedral still show such extensive remnants of a general coating and traces of painting and gilding that it is certain that the whole front was brightly illuminated. Stains of colour—red and fair copper-green—are preserved in the west porches of Salisbury and in the great open north porch; here and there on the walls are patches of the general wash, and the wooden doors were painted. High up under the great open arches of the west front of Peterborough Cathedral I observed, nearly thirty years ago, whitening with much original thirteenth-century lining-out in red. Stukeley records that the sculptured west front of Crowland Abbey—which may be counted as one of the derivatives of the north front of Westminster—was coloured. Oliver observed the colouring of the sculptured front of Exeter Cathedral, and slight traces here and at the north porch are still visible. The wooden doors were bright red. Britton also noticed remnants of colour on the great Judgment portal of Lincoln, which, as we have seen, was practically a copy of the Westminster portal. At Westminster itself, it is known that the sculptured doorway from the Cloister to the Chapter House was brilliantly coloured and gilt. Similar evidence is to be found for the great foreign churches. I have observed traces of chevron patterns on the shafts of the west front of Reims; and there is record that the west portals of Notre Dame were largely gilt. The second half of the thirteenth century was indeed the special age of gilding, and the sculptured north porches would have been gay and glistening beyond our power to imagine. The rest of the exterior, except the marble shafts, capitals and bases, which were polished, would have been whitened and "picked out" with red. In the accounts of Henry the Third's works, whiteners appear, but we are not told if they were engaged on the exterior. In the orders for Henry the Seventh's Chapel, however, it is provided that the sculptures within and without should be coloured.

When the church was consecrated and the golden shrine of the Confessor was carried through the great central portal (in 1269), its fair shining beauty must have been entrancing.

Obituary.

We regret to announce the death on February 27, at Highgate, of Mr. George Lethbridge F.R.I.B.A., aged 76. The internment took place on Monday at Highgate Cemetery.

We regret to announce the death on March 2, of Mr. Thomas Edward Mundy, A.R.I.B.A., F.S.I., of Ember Lea, Elm Tree-avenue, Esher, aged 79. The funeral took place at Highgate on the 6th instant.

The death has occurred recently of Mr. Edmund Lewis, the Common, Whitchurch, a well-known Glamorganshire builder and contractor, who was for many years a member of local government bodies in the Cardiff-Penarth areas.

ST. PAUL'S BRIDGE.

At a recent Conference on this subject, the following statement, with covering letter, was sent to the Prime Minister asking him to receive a deputation:—

To the Rt. Hon. J. Ramsay MacDonald, M.P., P.C., Prime Minister.

St. Paul's Bridge.

Sir,—The undersigned are members of a Conference specially appointed by the Councils of the Royal Institute of British Architects, the Town-Planning Institute, the London Society, and the Architecture Club. They represent the concern felt by these four Societies on the subject of the proposed scheme for a bridge across the Thames opposite St. Paul's Cathedral. It is in view of the special urgency of the case (in connection with the possible allocation of public money) and of its enormous importance, that they ask the permission to appear before you by deputation; or if this is impossible, that a hearing should be allowed before the Ministry of Transport. The nature of the case which the deputation, if sanctioned, will present, is respectfully laid before you in the attached statement.

The design of the bridge would, no doubt, before execution, necessarily come before the newly-appointed Commission of Fine Arts. We venture to suggest that a matter so vitally affecting the public's interest in the æsthetics and amenities of London should come before that Commission at the present stage so that its views may be considered in conjunction with the practical and economical aspects before any commitment is made.

We are, Sir,
Your obedient servants,

Carmichael Thomas, William Davison, David Barclay Niven, *on behalf of the London Society.*

S. D. Adshead, W. R. Davidge, R. A. S. Paget, W. Rees Jefferys, *on behalf of the Town Planning Institute.*

Ralph Knott, E. Vincent Harris, R. M. Barrington-Ward, James Bone, *on behalf of the Architecture Club.*

Harry Barnes, Banister Fletcher, Paul Waterhouse, H. V. Lanchester, *on behalf of the Royal Institute of British Architects.*

Statement by Conference on St. Paul's Bridge.

The undersigned, being members of a Conference specially nominated by the Councils of the Royal Institute of British Architects, the Town Planning Institute, the London Society, and the Architecture Club, have, at a Session held on Friday, February 22, 1924, issued, by unanimous resolution, the following statement of their opinion:—

It appears to us, as representing Societies all of whom are concerned in a greater or less degree with the attempt to consider practically, æsthetically and economically the problem of London's need and development, that the expenditure of public or other funds on the scheme for a St. Paul's Bridge, which is, we believe, now before the Court of Common Council, the L.C.C., and possibly the Ministry of Transport, should be vetoed or deferred. We protest against it chiefly because it seems to us to be conceived without sufficient breadth of outlook. To many of us it is a matter of conviction that no large and important road and bridge schemes within the Metropolitan Area should in these days be taken in hand without the previous preparation of a complete and comprehensive plan for the re-arrangement of London's traffic ways. London's great size, far from being an excuse for piecemeal changes, actually renders them, in our opinion, inexcusable. Apart from this consideration we feel that the scheme lacks forethought and ignores certain existing conditions.

Its road connections on the Surrey side appear to unite it with a point which already has direct and easy access to the little-used Southwark Bridge, which is within 300 yards. In this respect it would seem that its utility is unimportant. In any case it is not, as far as the public knows, linked up with any thought-out scheme for the town planning of the Surrey area.

On the Middlesex side, its utility again is questionable, while its disadvantages are obvious.

The choice of the east end of St. Paul's Churchyard as a space for the encouragement of additional traffic appears to us singularly unfortunate, and it appears likely that the arches carrying the approaches between viaduct and viaduct may produce an embarrassment of street planning and of hygienic arrangements in a crowded area which is not yet fully considered.

Quite apart from questions relating to the stability of the Cathedral—questions which, we believe, are sufficiently grave—it is clear that the introduction of a north and south highway at this part of the City must lead to a serious obstruction of the existing east and west streams of traffic, both that in Cheapside and that in Cannon-street.

If there is, as it seems to us, any chance of the proposed bridge and its contributary roads becoming a definite impediment rather than an improvement to existing traffic conditions, it is clear that funds spent on it will be funds spent amiss.

It is, therefore, on the general ground that we believe the scheme to be based on an inadequate study of present difficulties and an incomplete survey of remedial possibilities that we most conscientiously urge its abandonment or postponement.

If, as is possible, the project is being hastened forward as a means of finding work and wages for some sections of the unemployed, we would respectfully point out that two bridges at Richmond and Mortlake, already approved in connection with the approach roads in the western river-side suburbs, are immediately ripe for construction. These form part of a considered system of general road improvement.

We press these points with a sense that the views we put forward and the anxiety of which they are the outcome are sympathised with not merely by the Societies which appointed us, but by a large section of the thinking public, who would with us deplore the calamity of large public expenditure on a work which may easily prove to be a costly blunder, likely to add to rather than diminish the difficulties of the traffic problem.

Rating.

Mr. C. Dalgliesh recently gave the second and third of his lectures on rating, at the College of Estate Management.

In the second lecture, Mr. Dalgliesh, having dealt with the difficult and interesting questions arising out of the valuation, for rating purposes, of large residential properties, proceeded to discuss the broad principles governing the use of the "contractors' theory" in dealing with such properties as town halls, universities, works, factories, and the non-productive parts of railways and waterworks. The question of the rate of interest to be applied in such cases was considered in some detail, as the lecturer fully realised the difficulty which arose out of the Chertsey case. The governing principles used in valuing quarries, coal-mines, and other similar properties were described, and the necessity for seeing that a sufficient amount was allowed for "statutables" was stressed.

In the third and last lecture, the rules governing the admissibility of evidence as to trade were considered and explained. It was pointed out that only where evidence as to actual lettings was wanting, or where it was impossible to arrive at the rateable value by comparison, did the courts admit such a reference. Example valuations of all the more typical cases dealt with in this way, such as public houses, theatres, and cinemas, were given. In closing, the lecturer dealt with the broad principles established by custom, practice, and the courts in the valuation for rating purposes of railways, tramways and waterworks. He pointed out that the item which often gave rise to serious difference was, as a rule, the "tenant's share," as many of the other items in the calculation were matters of accountancy.

A DISCUSSION OF PRINCIPLES FOR FUTURE BUILDING.

Continuing his series of lectures, Professor A. E. Richardson lectured recently at Pembroke College before the Cambridge University School of Architecture on this subject. In the course of his remarks, he said the present stage of architectural education, using the term in its broadest sense to include those who had received their training privately as well as those who had had the benefit of specialised training, had resulted in elevating the scientific art from the experimental level to a platform of academic status. The term "academic" in this sense being used to class all works derived from tradition. The issue at stake, however, was still confused by undue observance of old work as well as an overweening desire on the part of artists to place fashion above truth.

The modern view point was a catholic one in so far as it noticed the pictorial effect of past achievement. It had resulted from close study, for many centuries, of past building expression; it was based, moreover, on a prejudice for the qualities of form, and was biased towards the purely decorative rather than inquiry into the structural merits of building.

From over study of the past, that was to say, the pictorial aspect of it, the modern in building had arisen, the modern as they knew it, as the French knew it, and as the Americans understood it. It was true that they had reached a stage when renderings of conventional architectural form had reached the limits of expansion in an academic sense, and when a new old style was sought to keep convention active. It was a fact, however, that the present reaction and demand for more logical methods arose from the senseless restraint imposed on artists by prejudices which favour decorative tendencies.

The art of building in this country had reached a curious stage. It represented this period as surely as the art of the Victorian age represented the years of frantic experiment with Gothic, Classic, and every known style. It was impossible to change the work so built or building. As the latest phase of recency it was modern, and there it remained, but to-morrow and the next day it would recede into the limbo of things half-remembered.

As far as they of the moment were concerned it was an interesting sign-post in the life of the nation, and it served to direct them to something better. The twentieth century was still in its youth; were they, as executants, to see it pass into middle age without achieving the true distinctions of manhood? Was it to be written a century hence that the period immediately following the Great War had no architecture worthy of the name at a time when the interests of the whole nation were turned upon the question of building? For they were building now on an unprecedented scale, but architects were not doing the work. How, then, could a change be effected to rescue the scientific art from degeneracy?

Continuing, Professor Richardson said he had endeavoured to explain the present position of building and to touch upon the attitude of executants and the public towards the development of a broader and more defined system. The theory of a method of expression suited to existing conditions and elastic enough to include future possibilities was surely not beyond the comprehension of practising architects. Apart from a restatement of what was known of basic principles it was unwise to attempt to describe architecture or methods of design. If the arts were subjected to close analysis, and their motifs and exemplars set down in diagram form and dissected, item by item, there resulted a certain standardization. This method had been adopted by Guadet, it was being experimented with by modern writers. There were at least, two books due for the press. Within specific limits it had its advantages, but undue observance of laws and rulings thus preconceived would not be productive of fine art. The Beaux Arts system with its classic view point was another instance of the synthetical method, but it was significant that this system had reached its limits and was not regarded seriously by thinkers.

In some quarters the suggested development of a system of structure which would represent present and future conditions of use and function was thought of as being likely to produce a total eclipse of art culture. There were those who opined that buildings of fantastic shape and crudity would result immediately tradition was departed from. A little reasoning would clear this debatable point. What was desired was not so much a new style of building, not so much a departure from what was known, or unbridled originality, as a return to principles inseparable from the vitality of the art. The main issue was that originality was impossible apart from the truth; originality, moreover, was an abstract factor, it could not be exactly defined; how it was gained in the scientific art of building could not be stated.

It might, perhaps, not be possible for the present generation to evolve a new style of architecture. There would be those who would have recourse to fantasy, those who would continue to follow the fashion, and those who would be content to continue to imitate, and caricature, old forms. The structural theory, which had little to do with construction, the latter being merely the means to the end, did, on the other hand, offer a *via media* from present difficulties, and, if rightly appreciated, would be productive of a method of building suited to present and future needs; more especially for the future, for a style was not produced at command. He did not suggest for a moment that they should discontinue their study of the past; it would be suicidal so to do; but they should examine historic art in an enlightened way in order to realise its lessons and to distinguish the good from the bad, as well as to ascertain truths first in order which on the surface were not apparent. Form as well as structure had its share in architecture; it offered types and qualities which would be found to be immutable. Tradition was useful as a species of intellectual scaffolding, but it was useless as an attribute of structural development. The spirit of research, of reasoning, and logic was superior to slavish imitations of tradition. The present task was to re-establish definite principles, which were superior to form, and if the need arose, to subordinate form to principles, and the more closely they approximated to basic laws the less would they desire to imitate the external representations of past art, which more often than not were but a pale reflection of primary truths. The compelling force demanding expression in building was that of humanity; patronage came from divers sources; it was no longer confined to the wealthy or to the State, but was a demand insistent from all ranks of society. To treat the demand of one's fellows with disdain or to attempt to envelop the newer conditions which demanded specific treatment with the worn mantle of tradition was almost as hopeless as Canute's command to the tide.

The philosophy of structure, bound up as it was with realities and questions of use and function, although capable of intellectual interpretation, demanded something more than crude expression. Bold statement was as bad in its way as slavish imitation. The man who was equipped with knowledge of the past was in a better position to realise structure than one who relied on elementary dexterity. Architectural training distinguished the architect from the engineer or the builder. The experiment of a return to traditional methods, although sound in some respects, had the specious failing of paying more attention to form than to utility. It had served one useful purpose inasmuch as it had directed attention to the lack of a structural policy.

The issue before architects at the moment was the same that had ever been present since late mediæval times, that was the truthful expression of contemporary conditions of life. The difficulty had been, and still was, to demonstrate in the concrete and in a characteristic, if abstract, manner the sum total of those conditions.

The structural theory demanded truthful exposition, but the truth was not always polite. After all architecture was as much an art as it was a science, and structure, which was more than the skeleton of building, might be direct and deliberate, it might also be vigorous and upstanding, but it might not always be beautiful.

At this juncture, continued Professor Richardson, it was only fair to again revert to the artistic aspect of the question. Design either structural or decorative, could only result from resistance. That was to say, there must be certain definite reasons for the building to be; in other words, there must be a demand and a given set of conditions. Designs produced without resistance could be classed at once as fantasies, whether they were derived from known motifs or were merely speculative inventions. He had experimented with this branch of design and had found it to lead into the paths of external form and massing unrelated to structure. It was, therefore, essential in building up an architectural idea to arrive at synthesis by analytical means. It was neither wise to limit architectural study to certain phases of history nor to give undue preference to any particular phase, however good the latter might be. Taste, which was essential to good work, must be catholic in its outlook in so far as a study of decorative qualities was concerned.

The issue they were facing at the moment was one that had cropped up many times during the last century; it concerned the need for a form of architecture suited to the present day. Hitherto the question had arisen and had been as summarily dismissed, for architects found it more convenient to go on using known forms and difficult to invent new.

Architecture, like most other intellectual arts, was largely an affair of compromise. It had its cycles and its periods; there was no finality, nothing definite could be stated regarding the course it would take. It had its poetic flights, its prose moods and its dramatic moments of blank verse; it also demanded, on occasion, mere pedestrian exercise. The very variety of its scope militated against general co-ordination and stereotyping. We must not forget that this was the present and the past was the past, otherwise they would continue the vice of regarding effect to be more important than cause.

The mastering of the theory of structure must be the aim of those who would invent a new order of things for building. It must be understood that, in addition to observance of this principle, a designer must be an artist; he must, in short, have had acquaintance with all that was known, and all that was best in past and contemporary art. His outlook must be broad, it must not be limited to the narrow groove of his immediate surroundings —the drawing board and the office—but should embrace the aspects of life and of the kindred arts. The first condition was that an architect should know what he desired, what the client desired, and what would best suit the needs of the site and fulfil the conditions imposed. He must never forget that in addition to being the creator of a building, monument, or work of art, he was also the adviser, and if, after study, he found the conditions

to be of a nature demanding revisions, he should say so. Too often conditions were imposed by a client or a building committee that were unworkable. It was the first essential that they should be modified. Starting from the basic theory of a structural plan, which did not attempt deception, the same ruling of truth and direct statement should permeate the whole grouping of the design both internally and externally. There should be no make-believe or addition of features solely for effect.

The rule of character and fitness applied equally to every part of a building, to the mass as well as to the articulation of the memberings. There should be consistency of design both externally and internally. The structural theory would help towards the development of a definite and expressive style but, as previously stated, it would not do everything. There arose inevitably a point in the realisation of conditions when artistry came into play to co-ordinate the crudities of structure. It was then that the best qualities of past art could be resorted to, not with a view to lifting detail *en masse*, but rather in the direction of bringing to bear the theories gained by methodical study of the work of the past, and to recast them in the crucible of the mind. Study of the past made clear that each phase of history had evolved a complete and definite system of expression. There had always been present harmony, proportion, contrast, and material values such as texture, and other auxiliary factors, to freshen the general idea and to give point and finality to the details. The danger lay in selecting any one of the known historical styles, or a new old style, and literally riding it to death. Neither was it possible, even when frenzy dictated, to mix the styles in the hope of producing novelty. The electic method was a false doctrine. Archæology had at least done one service in defining the different styles. The service still to be undertaken by archæologists and historians was not to show specific differences of detail, but to reveal the conditions which produced the buildings and ornament, and to treat of the structural and geometrical principles which determined their raising.

The philosophy of structure pointed the way out of the maze engendered by over-observance of classic technique. There would, however, always be bad buildings, especially in a country where so little attention was given to the training of architects. For it was a fact that while only 10 per cent. of the architects of this country had received definite training in their profession, the remaining 90 per cent. who got the work had few qualifications to fit them for their calling. In the past, not the immediate past, despite misconceptions and mistakes, the art of building and the resultant forms corresponded to the needs of the times. The present reaction was not directed against the best of past architecture, which would always be referred to and could not be ignored, but aimed at the realisation of new truths arising out of the observance of principles which were eternal.

New Bridge at Norwich.

Whitefriars Bridge, Norwich, was closed to traffic recently. The City Council has decided to put a new bridge of reinforced concrete in its place, at an approximate cost of £16,000. This is part of a scheme of river-widening that is being carried out for purposes of flood prevention; it will also do away with the inconvenience of the present bridge to river traffic.

The original bridge at Norwich was built of wood about seven centuries ago, and belonged to the Carmelite monastery near by. In the fifteenth century it was rebuilt of stone, with one pointed arch, having a span of 30 ft. By 1835 it had fallen into a state of decay, and was then thoroughly repaired.

RESTORATION OF ST. PAUL'S CATHEDRAL.

Mr. F. L. Dove recently gave at Manchester University a lecture on this subject. Mr. H. B. Dixon presided. In the course of his remarks he said there was a tradition, but only a tradition, that a temple dedicated to Diana stood on the site of St. Paul's Cathedral in Roman times, but the first authoritative information they had was that in Ethelbert's reign a cathedral was erected by him and endowed with land in Hertfordshire which still remained the property of the Chapter. This cathedral stood for about 500 years, when it was, together with a large portion of the City, destroyed by fire in 1087. Steps were at once taken to rebuild it, and it was replaced by the magnificent Gothic fane which took 200 years to complete. This was at various times struck by lightning and very greatly damaged, and the spire, 534 ft. high, destroyed. The cathedral was patched up, but the spire was never reconstructed, and ultimately was completely destroyed in the Great Fire of 1666. After the fire the cathedral authorities were very anxious to repair and patch up the old building, and when Wren was consulted on the subject he regarded it as wholly past repair, and a commission of eight, of which he was one, was instructed to report on the rebuilding.

A great deal had been said and written about the foundations of St. Paul's, and although it would have been a distinct advantage if they had been carried deeper, yet on the whole there did not seem to be very much the matter with them. Subsidence of the building undoubtedly took place, due to the heavy weights, but it seemed to have been pretty even all round the dome, and the bulk of the settlement, if not the whole, took place whilst the work was in progress. As far as the lecturer had observed, no settlement in the foundations, nor in the crypt, had occurred for many years. Cracks and fractures began to appear long before the completion of the edifice, so much so that Strong, who was one of the first contractors engaged on the work (there were six of them altogether) was paid for 30,000 ft. of stone used in repairs whilst the work was going on. He believed that practically the whole trouble and damage that had arisen was due mainly to two causes, and in a lesser degree to a third. The first two were due to the fact that the interior of the piers was built of rubble with very large masses of mortar in it, and second to the stone having been laid with an extremely fine bed, in some places stone to stone. The minor cause, which was largely superficial, was the insertion of iron cramps and dowels. In fact, it was owing to one of these cramps bursting off a piece of egg and tongue moulding, which fell during a service, that alarm was first created about the condition of the cathedral.

A great variety of methods, some of them very ingenious, were exhibited in this old repair work. At one time stones were fitted and run with lead, and in the case of wide joints slates were inserted prior to running in the lead, and when he told them no less than about two tons had been taken out of the beds and joints of two piers, they would appreciate to what extent this was carried. It was a mystery how they succeeded in running the lead the distance they did, as it was so extraordinarily thin, frequently they had taken out pieces varying in size from two inches to twelve inches deep and three or four ft. long, and ¼ in. to ⅜ in. thick; the only conjecture that seemed feasible was that, before the lead was poured in, the stone must have been heated by braziers or some other means.

During the course of the work on the two piers at present dealt with, some 1,388 ft. of Portland stone had been cut out and replaced with new, and 48 tons of cement had been used in bedding and grouting up.

Hitherto only one pier had been dealt with at a time, occupying a period of eight years, and the work had now for some time been suspended whilst a commission, consisting of architects and engineers, had been considering whether or not other steps for the security of the dome could with advantage be adopted, but having regard to the fact that the dome had stood with the piers in the undoubted unsatisfactory condition in which they were found, and anything from six inches to nine or ten inches of the outer shell practically doing very little in the way of support, he felt that, with that average of nine or ten inches brought into full commission, the piers were to that extent larger from a weight-carrying point of view, and when the repairs to the whole eight were completed the supports of the dome would be immeasurably stronger than they had ever been, and he thought they might reasonably conclude they would quite well support the load they were asked to carry. In the light of their past experience and with the knowledge obtained by the work already executed, the lecturer thought it would be quite possible to operate on two piers at the same time, thus reducing the time needed by one half.

OXFORD'S PLANNING SCHEME.

A public inquiry was held recently, at the Town Hall, to consider the application of the City Council for approval of a resolution deciding to prepare a town-planning scheme under Section 42 of the Housing and Town-Planning Act of 1919. After the Town Clerk had outlined the scheme, the Master of Balliol, who appeared on behalf of the Hebdomadal Council, said the scheme also had the general goodwill and interest of the University. The reason why the University took no special part in the proceedings was due to members wishing to be considered rather as citizens than in any special category, as they knew the whole of the residents of Oxford were equally interested in the preservation of the beauty of the city. The University buildings were the most beautiful thing they had left in England, and everyone desired to preserve them. He was also in general sympathy with the scheme proposed. It was evident that the principle of zoning—applying particular callings to particular areas—was of great importance to the University. It was of great importance to the University to have plenty of space round the buildings without the intrusion of unsightly manufacturing business. Personally, he represented something which was moving in the same direction as the town-planning scheme was intended—the Cumnor Trust, designed for very much the same purpose, to preserve the amenities of the land around Cumnor for the good of the public. Through benevolence they had already been able to purchase and hand over to the University the whole of the ruins of Godstow Nunnery. Anyone who looked at the pictures of Godstow as it was 200 years ago—published in the local illustrated paper—and saw how much was lost to Oxford by want of foresight, could not fail to be shocked.

An Ancient Chantry.

A thirteenth or early fourteenth-century building has just been discovered at Gravesend. It is part of what was known as New Tavern Fort, and formed part of the Gravesend Blockhouse of the sixteenth century, which shared with Tilbury Fort, on the other side of the River Thames, the responsibilities of the protection of London from the raids of the Dutch and French. This ancient Chantry of Milton was lost sight of for nearly 200 years, and at some period, probably in the eighteenth century, the three-foot walls were covered in with bricks, and this fact probably helped to preserve the great hall in its present state. The building is now disused except that a part of the lower portion is utilised for stores. The Gravesend Public Library Committee is approaching the War Office with a view to arrangements for the preservation and suitable use of the hall.

HOUSING.

WE have received the following from Mr. John E. Yerbury, chairman of Tenant Co-operators, Ltd. We do not necessarily agree with all the opinions expressed:—:

Having spent many hours in the study of Major Harry Barnes's book on Housing, I have come to the conclusion that it is a clear statement of the present position, and that it contains all the essential data necessary to arrive at a final decision with regard to immediate action.

(1) Major Barnes's supreme test of the capacity of private enterprise in the past is the fact that surplus families increased from 320,000 in 1801 to 900,000 in 1911.

(2) If the failure of the past is to be converted to success during the present decade, then 1,200,000 houses must be provided by 1931. The whole of the labour available at present could only produce 700,000 houses; under normal conditions, only one-tenth of these would be occupied upon housing. Unassisted private enterprise cannot provide the houses required.

(3) The housing problem was not created by the war; only made worse. Private enterprise never has, and never will, provide houses for the poorest paid worker, unless wages increase to such a point that the poorest paid can pay an economic rent.

(4) Overcrowding is not a question of shortage of houses, but of the incapacity of large numbers to pay for proper accommodation.

Major Barnes's statement of the facts will be very wholesome reading to those who indiscriminately condemn, on the one hand, the landlord, land jobber, speculating builder and investor; and, on the other hand, labour and trade unions. Chapter XXVII is a valuable corrective. The remarks on the Finance Act of 1909-10 are also worthy of note.

The unexaggerated statement of the facts clearly shows that the three main factors in housing—land, material and labour—are each and all under the control of powerful organisations, whose interest it is to limit supply and raise cost. Land counts for something; material more; labour most. Personally, I feel, and I think this is Major Barnes's opinion on the whole, that the Land Acquisition Act, 1919, has practically given all the powers necessary with regard to land required for housing, and we are not concerned with other questions than housing for the moment.

It is to be hoped that the Government will obtain guarantees with regard to material and labour; but should it fail I think the whole facts should be clearly stated to the public. The force of public opinion must in the end make itself felt if the facts are given; and in my view would be sufficient to break rings, or trusts, in material, and to prevent restriction of output both in material and in labour.

In this connection the author's reference to the inter-relationship between industries is important, and it is this which adds to the serious responsibility of labour as a whole.

Major Barnes gives tables of the factors in cost, which I think may be accepted as proven facts:—

Land	6.6	
Roads and sewers	13.3	
Material ...	39.9	
Labour	26.6	
Other charges ...	3.3	
Profit	9.9	
	99.6	
	4	omitted dimensions to 4th place in calculations.
	100.0	

If it be remembered that labour represents about 50 per cent. of the cost of material it will be seen that it is to labour we must look for our greatest reduction in cost. And this can be given by increase in output, to the benefit of many of the workers who must be suffering from atrophy of the muscles through want of exercise, if one may judge from the way they work.

It cannot be possible to reduce the profit very much, nor the land and development charges, and such reductions as may be made will only amount to a small percentage of the total cost. It is, therefore, to material and labour that one has to turn for savings in cost; and I am inclined to think that 10 per cent. to 15 per cent. reduction might be made in cost of material if it were made quite plain that new sources of supply would be opened under the Trade Facilities Act unless the Government received guarantees against profiteering by rings, trusts, and combines. I am quite convinced, in my own mind, that with an assurance against unemployment, under conditions which would give the worker an adequate interest in increased profits, labour would readily and willingly increase output by 25 per cent. to 50 per cent.

The Minister of Health is negotiating with employers and operatives with regard to methods of increased employment, and one may hope that a scheme will be devised for obtaining a sufficient number of men to complete our housing requirements without interference with other branches of the building industry; with good will on all sides and public support for a Government guarantee there should not be any difficulty in this respect.

The numbers employed in the building trade had fallen by over 200,000 before the war. Wages increased, output decreased, and profit disappeared until building small houses became not speculative, but certain loss. Of course, the speculating builder ceased work, and the building trade began to lose its place in the industrial world as the second largest employer of labour.

Major Barnes gives an exhaustive summary and tables showing clearly the factors in rent, *i.e.*, (1) interest on cost, (2) maintenance; (3) insurance; (4) management; (5) empties; (6) loss on rent; (7) sinking fund; (8) rates.

1, 2 and 8 are the important factors, and it is for the provisions of finance at a low rate of interest that I have constantly pleaded in your columns, and have pointed out at the same time that rating reform (long overdue) is an essential to housing reform.

I do not think either Major Barnes or the National Housing Council allow sufficient for maintenance, which cannot be safely taken at less than 15 per cent. on the gross economic, or commercial, rent; viz., rent that gives fair profit to all legitimately interested in the provision of houses. Nor do I think the charge made in the tables given by Major Barnes as the rates factor is sufficient; the tables take as the basis of rateable value, not the "economic" rent, but the "estimated actual rent," and upon that figure charge rates at 10s. in the £, and if rating authorities assess on "actual" instead of "economic" rent they will be departing from the general practice objected to when speaking of total remission of rates. Major Barnes says that rent paid is the basis of rates; but this is only so if the rent paid is the real commercial rental of the premises; the man who pays less than a fair and proper rent cannot claim to pay rates on such rental; he is assessed on fair and reasonable rent.

I agree with Major Barnes's figure of 25 per cent. of rent as a working figure to estimate rates: but it must be 25 per cent. of gross commercial, or economic, rent, and not of an estimated rent to be charged to the poorest tenants having regard to their capacity to pay.

I find myself in general agreement with the views expressed by Major Barnes, but cannot subscribe to all his *obiter dicta*; for instance, I do not agree that "it is impossible to get people to regard the spending of other people's money as they regard their own." "There will always be waste in spending public monies."

There are plenty of people who are much more careful about the expenditure of other people's money than of their own; and many consider the waste of public money one of the worst forms of robbery, and impossible in a real patriot. Of such should be the Kingdom of Civil Servants.

With the second of Major Barnes's main conclusions, everyone who has taken any interest in the subject must agree. "Unless we make most vigorous effort, at the end of the present decade the position will be worse than in 1921." To my mind that is quite certain, without any shadow of doubt. Major Barnes's first main conclusion makes one think; I am not sure that I agree, but I am quite certain that unless something is done in the immediate future I shall be forced to accept that conclusion, as one does the premises.

I have from time to time in your columns and others stated a case, a remedy which I think might prevent the acceptance of Major Barnes's conclusion "that housing of the working classes has definitely passed into the same political category as education, old age pensions, and insurance."

I see two ways out of this position:—

(1) There must be a minimum wage fixed in every district which shall have such relationship to rent so that every worker will be in the position to pay an economic rent.

(2) Proper houses must be given at rentals within the means of the worker, that is (say) not more than one-fifth of his wages; (I think one-sixth is a fairer figure).

"The maintenance of the worker in a sufficient standard of life is as much a part of the cost of production as the maintenance of plant." My theory is that, with rating reform carried out, private enterprise could and would provide houses for the best paid worker, but not for the poorest paid worker. The Minister, therefore, should concentrate particularly upon the provision of, say, 250,000 houses, to be let at the lowest rental possible by public utility societies, or other means under special legislation.

If all charges were removed from rates which are not purely local a very great reduction would be made in inclusive rents. If loans were made at 3 per cent., repayable over a period of 100 years (from a fund raised at 5 per cent., repaid in 50 years), the loss would be £23 per annum for 50 years, with a gain of £31 per annum for a further 50 years. Upon every £1,000 spent (or say about £10 per annum per house), the "Chamberlain" scheme gives £12 12s. without the future compensation.

I anticipate that rating reform will reduce inclusive rents by 12½ per cent. Reduction in cost and increase in output will lower total cost by 15 per cent. and the combination of lower capital expenditure, etc., and saving on "outgoings" will enable houses to be provided to let at 7s. and 8s. per week. The local authorities should be asked to provide roads and sewers as their contribution to housing the wage earner of £2 per week and under. The revival of the Building Trades Parliament and a return to the spirit of 1919 would lead to permanent stability in the industry.

Building in America.

The New York Trust Co., in a pamphlet recently issued, state it is perfectly obvious the large volume of building in the past two years has made up the greater part of the post-war shortage. Taking the country as a whole, however, there is evidence that building requirements are still so large that the outlook is for at least another year of record building. The unprecedented volume of building construction reached its peak in 1923, with an estimated total expenditure for all types of buildings of almost £1,200,000,000.

THE WEEK IN PARLIAMENT.

Westminster, *Wednesday.*

The Subsidy.

Mr. A. Greenwood, Parliamentary Secretary to the Ministry of Health, informed Sir P. Sassoon that in cases in which the Minister was satisfied that builders, on the faith of assurances given by or on behalf of local authorities, had proceeded with building in anticipation of the approval of the local authorities' scheme for assisting private enterprise, the equivalent of the Government grant under the 1923 Act would be paid in respect of houses which would otherwise be eligible for assistance.

Wartime Buildings.

Mr. Jowett, First Commissioner of Works, informed Sir H. Brittain that the only war time buildings remaining in the Royal Parks were the aircraft buildings in Regent's Park and the Hospital in Richmond Park. Tenders were about to be invited for the demolition of the former, and arrangements were in progress whereby it was hoped the latter would be vacated in September, when steps would be taken to remove the buildings.

Office of Works Schemes.

Mr. Jowett, First Commissioner of Works, informed Lieut.-Commander Kenworthy that the average cost of the 5,178 houses built by the Office of Works was approximately £836, but many of these houses were constructed when wages and building materials prices were at peak level; the average cost of those now under construction was estimated to work out at from £400 to £450. These figures included the cost of roads, paths, sewers, and fencing, and every charge with the exception of the cost of the land. The types varied from flats consisting of living room, scullery and one bedroom, to houses consisting of living room, scullery, parlour and four bedrooms, with bathroom, &c. The number of houses to the acre varied from 10 to 12. Approximately 300 men were engaged on the houses now under construction. The whole of this labour was employed by contractors and not by the Office of Works. The building of further houses depended on the general housing policy of the Government, which was at present under consideration.

Demand for Bricks.

Major R. Williams asked the Minister whether in view of the demand for bricks which would arise when houses began to be built in larger numbers, and in view of the desirability of creating employment in the brick-making trade, he would consider the giving of assistance to companies engaged in brick-making to enable them materially to increase their output.

Mr. Wheatley said he was hopeful that the demand for bricks would be met by an increase of output by the industry without recourse to special measures on the part of the Government.

Exchequer Deficits.

Mr. Wheatley informed Mr. Black that it was estimated that on the basis of the present rents and charges the deficit to be made good by the Exchequer in respect of houses erected in England and Wales under the provisions of the Housing and Town-Planning Act, 1919, would be approximately £7,700,000 per annum. The deficit would continue for 60 years, but when the loans raised for roads and sewers were repaid at the end of 20 and 30 years respectively, a reduction in the annual sum would be effected. The total amount paid in respect of lump sum subsidies to private builders under the Housing (Additional Powers) Act, 1919, was £9,498,000. No further liability arose in respect of these houses. The liability of the Exchequer for houses erected to January 31 last under the terms of the Housing Act, 1923, was £28,000 per annum for 20 years.

Guild Contracts.

In answer to Sir K. Wood, who asked whether any housing contracts had been entrusted to the National Building Guild, Ltd., Mr. Greenwood said that the Minister had no knowledge of any housing contracts having been entrusted to the society in question.

Building Plans.

Mr. Hannon asked the Minister of Labour whether he would reconsider his decision that the statistics of approved building plans should in future be published only quarterly.

Mr. T. Shaw said, in view of the limited space available in the *Labour Gazette* it had been decided that the detailed figures relating to the building plans in each of various districts should in future be given only at quarterly intervals. The totals for all districts for which information was obtained, sub-divided to show various categories of buildings separately, were still, however, being published each month. He should be prepared to reconsider the question as regarded the district figures if he received evidence of sufficient demand to justify the expense of their monthly publication.

ROMAN FAMILY LIFE.

Sir Banister Fletcher lectured recently on this subject at the Central School of Arts and Crafts. He described the Roman circular temples, which, he said, were of peculiar interest to the whole Christian world as prototypes of the first Christian baptisteries, just as the Roman basilicas or courts of justice were probably of the early Christian churches. These were among the many instances in architectural evolution in which Christian forms were based on pagan originals, and helped them to realise that architectural styles were not divided into watertight compartments, but were evolved from one another, according to the changing needs of civilisation.

Of all the circular temples in Rome the little Temple of Vesta had the most attraction for English people, as the symbol of that united family life which the old Romans, like the modern English, regarded as the unit of the State. In its simplicity of plan, with its central altar-fire, it stood in the Forum Romanum as the centre of civic life, as a reminder of the sacredness of the Roman hearth, and its importance was intensified by the consecration of six "vestal virgins" to the service of the goddess. The convent-like building which housed them could still be traced, but of the temple little remained.

Other little circular temples there were, most attractive in their plan and treatment—the Temple of Mater Matuta, in the Forum Boarium, the temple at Tivoli, rising sturdily over the rocky gorge, and that at Baalbek, with its unique external design.

Sir Banister then gave an exhaustive account of the most majestic of all circular buildings in the world, the famous Pantheon at Rome, with its great expanse of dome open in the centre to the winds of heaven. Finally, he described briefly but vividly, the large halls or "basilicas" which, while housing courts of justice, served as rendezvous for business and consultation—the "Royal Exchanges," in fact, of ancient Rome.

BRITISH ARCHITECTS' CONFERENCE

The annual conference of the Royal Institute of British Architects and its allied societies in the United Kingdom and the Dominions Overseas will take place at Oxford from July 9 to July 12. A preliminary programme is in course of preparation by the Executive Committee under the chairmanship of Mr. Edward P. Warren, F.S.A., President of the Berks, Bucks and Oxon Architectural Association. It is confidently anticipated that a record number of members of the R.I.B.A. and the allied societies in the United Kingdom and in the Dominions Overseas will be present at the meetings, the banquet, the visits, and the excursions which are now being arranged by the Executive Committee. A preliminary programme will be issued at an early date. Ladies will be especially welcomed and it is hoped a large number will be present.

The remarkable popularity of the previous conferences at Liverpool, Cardiff, and Edinburgh, and the attractions offered by Oxford to a gathering of architects, should contribute to ensure a memorable success for the Conference of 1924.

ARCHITECTS' AND BUILDERS' INQUIRY BUREAU.

*** *We are glad to give questions and answers but cannot accept responsibility for contributed replies, especially on legal matters.*

Walls of a Small House.

[Reply to J. A. E.]

Sir,—Squared rubble walls 12 in. thick with cavity and inner shell of breeze blocks, or better of 4½ in. brickwork if obtainable in the neighbourhood, should form a thoroughly sound job provided the cavity is well ventilated, which is of the utmost importance.

The base of the wall would be built solid about 1 ft. 9 in. or 1 ft. 10 in. thick, leaving an offset of 3 or 4 ins. upon which the joist of the lower floor can rest, the damp course being first laid over the whole thickness of the wall. The bottom of the cavity must be ventilated with air-bricks into the open air, and the cavity carried right up to the eaves. The inner shell need only be carried up as far as the plate carrying the upper ceiling joists, leaving the cavity open to the roof, which will be quite sufficient to ensure a good draught through the cavity.

A breeze block shell would not be strong enough to bear an intermediate floor, in which case the floor joists would be run through the cavity into the outer wall, and it is a wise plan to coat the ends of such joists with creosote.

"X."

Specification for a House.

Sir,—In the specification for a house in which there is quite a considerable amount of half timber work in oak, the following clauses appear:—

"Oak to be reasonably seasoned, sound building quality. Any shakes, large, loose or dead knots will be rejected."

Some of the scantlings are as large as 12 in. by 5 in., and when they were examined in the shop seemed quite dry and sound. If numerous cracks and small splits begin to appear in the surface a few weeks *after fixing*, what is the position? Brickwork has been fixed in the panels, and it is now a very difficult matter to replace any of the timbers.

The oak is specified to be finished by rubbing with linseed oil only. No nationality of oak was mentioned, and the bulk of it has been done in English. In one or two small places an ugly knot has been removed and covered by a small piece neatly let in, but of course it shows. Can the contractor claim the right to do this?

These are points upon which experience of work in oak would be useful, and if the Bureau deals with such as these it will prove of great advantage to readers. Such a page is more valuable to those in the Building Trade than whole volumes of academic discussions.

"Northern Architect."

[Reply.]

The specification appears a little loose, both as to description and wording. "Reasonably" is a term that can be interpreted in many different ways, and post-war practice has been to judge reasonable seasoning in a somewhat less harsh manner than in "the good old days." Since no variety of oak was specified, it was natural to select English as being far and away cheaper, and being the usual choice for external constructional work owing to its unrivalled durable qualities. It is a very difficult matter to obtain English oak in large scantlings that will not develop shakes, but such cracks are not detrimental to its strength nor, in the opinion of many, to its beauty, and it would not be reasonable to reject any that were not of a particularly serious nature. In cutting out certain knots and patching the contractor seems to have taken a great liberty, as a natural knot is less unsightly than the neatest patch, which may in time shrink and drop out. Where such patches are particularly prominent, and provided the contract will stand the delay and disturbance, it would be advisable to have the members affected replaced. It is, of course, better to avoid such disturbance if matters are not too serious, but such things have to be judged on their own merits. M. A.

THE BUILDING TRADE.

ESTIMATING FOR SMALL BUILDERS.

By J. H. BARNS, F.I.O.B.

PAVINGS.

Terrazzo is the cheapest form of marble flooring or "wall lining" laid *in situ*. This class of work is usually performed by special firms, who charge from about 14s. to 20s. per yd. super for plain work; borders at a small additional cost. The price will depend upon the area to be covered, the size of the marble chippings, and the special colouring matter required for the cement ground or white cement.

Although this work is often performed by specialists it is an advantage for a small builder to be prepared to do a little of this work, particularly in making good after alterations, as it will cost comparatively a large sum for specialists to send many times to perform a small amount of making good to terrazzo.

The following is the approximate cost for a builder by his men to lay terrazzo in reasonable areas, small areas at higher prices :—

— per yd. super terrazzo with white marble chippings and ground in natural colours to floors:

	s.	d.
1 bus. (1 cwt.) ⅜ in. marble chippings, 8s.	8	0
½ bus. Portland cement, 3s... ..	1	6
Labour laying, per yd., 1s. 9d.–2s. 6d.	2	0
Labour, &c., rubbing	4	0
	15	6
Cartage and use of tools, say ..	1	0
	16	6
Profit and oncosts, say 15 per cent.	2	6
	19	0

If the chippings were of larger size or different colours this would increase the cost. If the ground were required for some definite colour, such as green or red, this would need the addition of about 2 lbs. dry (lime) colour per yd., costing 6d. to 1s. per lb. The cost of screeding floor to receive terrazzo would be measured separately.

Yds.

— super cube roman marble mosaic.

The price will depend upon the design of the filling and border. Approximate price for :—

20 yds.	50s. per yd.
40 yds.	46s. per yd.

Larger areas somewhat cheaper.

Marble floors laid complete in say 12 in. by 12 in. squares, black and white, alternately with sanded face—about 36s. per yd.

Ditto, but 12 in. by 12 in. dove and white—about 40s. per yd.

Hopton Wood stone—about same price as above.

DELIVERY OF GOODS.

In many cases the small builder will find it necessary to purchase goods that are urgently required in small quantities, and as he may not be able to wait for the delivery of the goods until the merchants' vans are in his neighbourhood, advantage cannot be taken of the offers of free delivery, but he must arrange for goods to be collected and delivered by a firm of carriers.

It may be asked why trouble to include such times, which may be classed as undefined expenses. There is no special reason except to remind estimators that such charges are occasionally incurred.

The builder should see that the obviously necessary but undefined expenses are included.

The table on this page gives the approximate cartage rates for London area.

Miles up to :	3	4	5	6	7	8	9	10
Weight over—								
28 lbs. & up to 56 lbs. ..	9d. ..	9d. ..	1/2 ..	1/6 ..	1/6 ..	1/10..	1/10..	1/10
56 lbs. to 1 cwt. ..	9d. ..	1/2 ..	1/6 ..	1/10..	1/10..	2/3 ..	2/3 ..	2/3
1 cwt to 1½ cwt. ..	1/6 ..	1/6 ..	1/10..	2/3 ..	2/3 ..	2/8 ..	2/8 ..	2/8
1½ „ 2 „ ..	1/10..	2/– ..	2/2 ..	2/6 ..	2/6 ..	3/– ..	3/– ..	3/–
2 „ 3 „ ..	2/10..	3/– ..	3/2 ..	3/9 ..	3/9 ..	4/– ..	4/6 ..	4/6

THE INSTITUTE OF BUILDERS.

Annual Dinner.

Mr. F. J. Gayer (President) occupied the chair at the annual dinner of the Institute of Builders, held at the Hotel Victoria, Charing Cross, on February 27. Among the guests present were Mr. H. Adamson, Mr. Dudley Bartlett, Mr. E. J. Brown, Mr. J. A. Brown, Mr. R. B. Chessum, Mr. B. H. Chessum, Mr. W. E. Davis, Mr. Claude Ferrier, Mr. G. Topham Forrest, Mr. P. F. Gleed, Mr. E. Stanley Hall, Mr. Stanley Hamp, Mr. F. Higgs, Mr. E. J. Hill, Major R. J. Holliday, Mr. E. C. Holloway, Mr. H. T. Holloway, Mr. R. E. Holloway, Mr. F. D. Huntingdon, Mr. Ralph Knott, Mr. F. W. Loasby, Mr. W. G. Newton, Mr. E. J. Read, Mr. A. Roome, Mr. S. E. Roome, Major A. D. S. Rice, Mr. F. Shingleton, Major Leslie Shingleton, Mr. Sydney Tatchell, Major A. F. Vigor, Mr. Frank Wall, Mr. A. G. White, Mr. C. Woodward, and Mr. D. C. Workman.

After the loyal toasts had been honoured, Mr. H. Mathews proposed "The Architects and Surveyors." In the course of his remarks he said the builders had no opposition with the architects and surveyors, although, of course, they must occasionally come into conflict when their points of view differed. The building body was composed of architects, surveyors and builders. The three had one single object and only by close co-operation could they get through the work. He would suggest the architect should put himself in the place of the builder, and endeavour to understand the builder's position. They would then, probably, get on even better than they did. In conclusion, he suggested the whole body should unite so that "Charing Cross Bridge Should Go."

In responding for the architects, Mr. E. Stanley Hall said the Architectural Association was anxious to welcome students of all crafts which bore on the subject of beautiful buildings. The Association would be only too glad to help them; and they, in their turn, would help the Association. If architects followed the fashion of going to builders' yards, it might be possible that builders, for their part, might like to learn from architects the basis of architecture and architectural taste.

The total number of students at the Architectural Association (170) was larger than that at any other school in Great Britain. Their one object was to look after the architecture of the next generation. He hoped that architects, builders, and craftsmen would come together and get on friendly terms. In regard to education he was glad to see they were trying to found a chair of Building Science. The Association would be only too glad to help and congratulated them on the step they were taking.

After Mr. Perceval Gleed had responded for the Surveyors, Mr. Roland B. Chessum, in proposing the "Institute of Builders and its President," said their development of recent years was due to the energy and spirit of their respective presidents. The dignity of building could only be preserved by setting a high standard compatible with any other branch of the industry.

Continuing, Mr. Chessum said in 1920 they had 239 members, in 1921 305 members, in 1922 402 members, and in 1923 654 members. He considered this remarkable increase was due to the enthusiasm of such men as their present president.

The President, in response, said although they had not yet a Royal Charter, he hoped in the near future entrance to the Institute of Builders would be by examination. A certain amount of progress had already been made in connection with a Chair of Building, and in order to encourage students the Institute had granted a number of medals to the different trades and centres up and down the country. It was extremely necessary to encourage technical education. The Institute was not concerned with industrial warfare, or, in other words, suicide; but he hoped the Labour Government would convey to the various trade unions the great necessity for the augmentation of the building trade industry.

Ald. G. Brittain then proposed "The Guests," to which Mr. Sydney Tatchell briefly responded.

BRISTOL CLERKS OF WORKS' DINNER.

The Bristol branch of the National Federation of Clerks of Works and Builders' Foremen's Association held its annual dinner at the Royal Hotel, Bristol, on February 23, with Mr. A. Gardiner in the chair.

Proposing the toast, "Architects, Engineers, and Surveyors," Mr. R. Slaughan said the three professions were professions which clerks of works and builders' foremen could well appreciate.

Mr. W. S. Skinner, in response, said the speaker had alluded to the Tomb of Tutankhamen, and he, the speaker, would like to say a word about the work of the Egyptians, who moved huge slabs of granite great distances and fitted them so close together that to-day a sheet of paper could not be placed between the joints. These slabs were well placed on columns 60 or 70 ft. high simply by man power. It was marvellous.

Mr. C. W. F. Dening said that architects were members of a silent community, who endeavoured to let their buildings speak for them. There were some buildings, even in Bristol, that actually shouted at them.

Mr. C. Willis, submitting "The Builders," said that half the trouble in the trade arose through lack of continuity of employment.

Mr. W. S. Weeks, President-elect of the Master Builders' Association, in response, said apprenticeship was the great hope of the trade, but it was no use for employers to take apprentices unless the builders' foremen, clerks of work, and operatives would teach them and encourage them. Other toasts were "The Bristol Association of Clerks of Works and Builders' Foremen," proposed by the Chairman, "The Chairman" and "The Visitors."

CLERKS OF WORKS' ASSOCIATION.

The Incorporated Clerks of Works' Association held their 41st annual dinner at the King's Hall, Holborn Restaurant, on February 23. Mr. W. A. Forsyth, F.R.I.B.A., presided. Among the visitors present supporting the Chairman were Messrs. W. Woodward, F.R.I.B.A., F. W. Troup, F.R.I.B.A., C. Armitage, F.R.I.B.A., Lieut.-Colonel A. C. Preston, V.D., Alderman W. Peet, Messrs. F. Hall-Jones, M.S.A., Roland Welch, A.R.I.B.A., Clifford Trollope, F. G. Minter, Dudley Bartlett, H. A. Gregory, E. E. Yewen, and Noël Heaton.

After the loyal toasts had been honoured, Mr. A. H. Taylor proposed "The Architects," and Mr. William Woodward, F.R.I.B.A., responded.

Mr. P. J. Luxton proposed "The Surveyors," and said, although the term surveyor meant all sorts of things and all sorts of people, it was usually understood in their company to mean a quantity surveyor. He was the man whom the building trade generally, and clerks of works in particular, had most to do with in London and the large provincial towns. The building owner to-day who ventured on a large outlay without calling in the assistance of a quantity surveyor would live to regret his folly. It was a big tribute to the profession that in connection with many contracts, involving large sums of money, both the building owner and contractor accepted the decision of the quantity surveyor without question.

Mr. A. G. Cross, whose name was coupled with the toast, also responded.

Mr. A. H. Castle, in proposing "The Worshipful Company of Carpenters," expressed the Association's gratitude to the Company for allowing them the use of the Hall for their meetings. The Worshipful Company of Carpenters, he said, had always been leaders in the production of well-trained craftsmen, and in later years in the promotion of technical education. In thus attempting to provide the additional skilled men so much wanted in the building industry the Carpenters' Company had well earned the thanks of the whole community.

Lieut.-Colonel A. C. Preston, V.D., Past Master of the Carpenters' Company, in response, assured them, on behalf of the ancient Company to which he belonged, that they were delighted to give the Association the use of the Hall for their meetings and for the work they did.

Mr. A. J. Dorey proposed "The Builders," and, in response, Mr. Clifford Trollope said the clerk of works was a great asset to the builder. He helped them through very trying and difficult times, and the builders could not be too thankful for the assistance given them.

The Chairman proposed the toast of the "Incorporated Clerks of Works Association," and said they must all feel that the position of English building was pre-eminent in the world. There was no country where construction of permanence in building was more understood than in Britain, and that condition was in a large measure due to clerks of works. He would like to thank the committee for circulating their Journal amongst architects. It was of very great assistance and it was invariably interesting. He would appeal to them to help in the promotion of the charitable side of the committee's work. They had an opportunity of subscribing to the benefit and pension fund, and he found this fund was very jealously guarded; it was well supervised and administered, and clerks of works incapacitated by illness, accident or otherwise were helped in times of need.

Mr. F. J. Pitts responded, and said the chief object of the dinner was to help the Benevolent Fund. There was one special point he wanted to put before the architects. At the present time an interesting question was being discussed at the meetings of the Association, namely, the question of insuring clerks of works when on a job. Generally speaking, that was never done. It was never thought about. It would be a little item to allow for in the bill of quantities. Members of the Association wanted the architects to consider the question and see if they could not include a small sum in the bill of quantities to insure the clerks of works against accidents. He would like them to think the matter over and put it before the notice of the other members of the Royal Institute.

Mr. J. W. Groom proposed "The Visitors," to which Mr. H. A. Gregory responded.

After Mr. W. Lake had proposed "The Chairman," Mr. Forsyth, responding, said in reference to the insurance of clerks of works, that it was a most important thing, and he would do his best to bring it before the Royal Institute of British Architects.

COMPARISON OF PRICES OF BUILDING MATERIALS, &c.

We publish a table giving the prices of the principal building materials on March 1, as compared with the price for February 1, 1924.

Material.	Feb. 1, 1924. £ s. d.	Mar. 1, 1924. £ s. d.	Fall. %	Rise. %

STEEL CONDUITS AND ELECTRICAL WIRING.

The British Engineering Standards Association has issued a new revision of the Standard Specification for Steel Conduits for Electric Wiring (B.S. Specification, No. 31), which was first issued in 1906 and revised in 1910. The following modifications have been made to the original standards, which it is interesting to note had been almost universally adopted:—

Two additional diameters have been included, *i.e.*, ½ in. and 2½ in. In the case of conduit having a larger diameter than 1 in., the screw threads have been slightly shortened. In other respects, the specifications for the conduits remain the same, but a comprehensive range of standards for the fittings used with conduits have been included, together with tests to be applied to the materials used in the manufacture of both the conduit and the fittings.

The use of this specification will ensure the supply of a good practical quality of steel conduit and fittings, and the wider its use the greater will be the benefits.

It should be recalled that about three years ago the Government Departments decided to co-ordinate their own specifications for electrical apparatus, so as to make use as far as possible of ordinary good class commercial articles, and for this purpose set up an interdepartmental Committee and made arrangements to secure the assistance of the B.E.S.A. This Committee decided to adopt the British Standard Specification No. 31, and recommended its extension to include a 2½ in. tube with a further addition of detailed standards for fittings. The B.E.S.A. Committee brought together all the British makers of conduits, and after considerable discussion general agreement was reached. The Interdepartmental Committee found that the revised specification would meet all the ordinary Government requirements, which, hitherto, in the absence of a standard specification for the fittings, had, in some cases, been special to each department. This B.E.S.A. Specification, therefore, will set a standard for the makers, the Government Departments, and for all purchasers of good quality conduit, and the more British Standard Conduit and Fittings are demanded, the better for the electrical industry and the public.

Copies of this publication (No. 31, 1923) may be obtained from the B.E.S.A. Publications Dept., 28, Victoria-street, London, S.W. 1. Price, 1s. 2d. post free.

£1,000,000 for Irish Roads.

The Irish Free State has made available £1,000,000 for road improvement throughout the country. The scheme will affect every county council and urban district council in the Free State, and £100,000 will be allocated to Co. Cork. Preference will be given in the workmen engaged to suitable persons who have served in the Free State Army.

LABOUR IN THE BUILDING INDUSTRY.

A REPORT on the supply of skilled labour in the building industry has been issued by the National Housing and Town-Planning Council and signed by the Chairman of the Council (Mr. F. M. Elgood) and the Secretary (Mr. Henry R. Aldridge), on behalf of the Committee. From this report we take the following abstracts:

In the following table the numbers of skilled craftsmen engaged in Great Britain in the building industry in 1901, 1911, 1914 (July), 1923 (February), 1924 (January) are clearly set out.

	1901.	1911.	July, 1914.	Feb., 1923.	Jan., 1924.
Bricklayers	120,288	106,193	73,671	58,540	57,170
Masons	97,398	65,155	34,381	21,490	22,270
Carpenters and Joiners	306,355	238,425	126,345	123,820	125,010
Slaters	16,111	13,909	4,154	5,190	5,210
Plasterers	36,238	28,784	19,479	16,290	16,070
Plumbers	76,065	76,511	33,009	33,090	34,440
Painters	176,007	200,115	132,479	109,800	106,860
	828,462	729,092	483,518	367,220	369,030

The main factors responsible for the decline in the numbers of skilled men in the industry are as follows:

(1) The first of the causes of the shortage is to be found in the fact that for many years past the number of apprentices flowing into the industry has been insufficient in volume to replace the depletions in the industry.

The reasons for the shortage of apprentices are three-fold:

(*a*) The unwillingness of parents to place their children in an industry which does not offer steadiness of employment at a good standard wage, and the difference in general attractiveness of careers opening out in other industries.

(*b*) The absence of any kind of responsibility—falling on the employer—for securing and training apprentices.

(*c*) The entire cessation of apprenticeship during the war.

Apprentices.

With regard to (*a*) it is beyond question that in the years preceding the war the industry was hard hit by severe crises of unemployment which produced much suffering amongst those engaged in it. The knowledge of this suffering without doubt acted as a potent factor in deterring careful parents from placing their children as apprentices to the industry. To these periods of unemployment must be added the varying nature of the occupation and frequent seasonal unemployment. The industry has suffered, and continues to suffer, as a result of the loss of time due to inclemency of the weather, especially at certain periods of the year. It is to be regretted that no workable solution has yet been found for "wet time."

The Committee are of the opinion that many parents have preferred to send their children into industries which offered greater steadiness of employment at wages which, taking the whole year round, were substantially higher than those likely to be secured in the building industry.

With regard to (*b*), the evidence obtained by the Committee places beyond question the fact that the sense of responsibility for securing and training apprentices clearly felt by large numbers of employers in the past has well nigh disappeared in some parts of the country. The Committee are informed, for example, that many large employers in the London area are unwilling to take apprentices. But whether the cause be that of unwillingness or indifference on the part of parents, or the absence of a sense of responsibility amongst employers, the result is the same. The proper recruitment of the industry has been neglected.

In reference to (*c*), with the virtual cessation of building during the war there was scarcely a single lad apprenticed during a period of four years.

Skilled Labour.

(2) There has been a substantial depletion in the number of skilled craftsmen arising from:—

(*a*) Migration to other industries in times of depression in the pre-war period.

(*b*) Losses to the industry during the war period as a result of death or migration to other industries; and

(*c*) Emigration to other countries, both before the war and since the war.

With regard to (*a*), the evidence submitted to the Committee places beyond question the fact that during the period of great building depression between 1906 and 1908 the number of men compelled to leave the industry as a result of hunger was substantial. Many found it better to secure constant work at unskilled or semi-skilled occupations than to continue in an industry which seemed to have no use for them as far as the prospect of earning a steady living wage was concerned.

From time to time public criticism is expressed in strong terms concerning the attitude of the men in the industry towards dilution. But it must in justice be recognised that in only too many cases the issue presents itself to them not as one of abstract argument, but of bitter memory of suffering experienced in the past by those near and dear to them throughout a time when it seemed to be a matter of national indifference whether they became chargeable to poor relief or not.

Concerning (*b*), the Committee find on enquiry that in one industry in particular there were great losses during the war period.

With regard to (*c*), the Committee find that in the period preceding the war there was a steady stream of emigration to other countries. Since the war—and more especially during the last two years—the outward stream of emigration has begun to flow again.

The Committee learn that 921 out of 4,000 carpenters (including ships' carpenters) left Glasgow in 1923 for the United States of America, where attractive high wages can be readily gained by skilled men. At the present juncture large numbers of bricklayers are also leaving the country.

Skilled Labour and Housing.

III.—The number of skilled craftsmen needed to execute a National housing policy.

In considering the number of operatives needed to build 200,000 houses a year two points emerge, viz.:—

(*a*) The number of skilled men necessary to build a stated number of houses; and

(*b*) The proportion of the men in the industry needed for the performance of building operations other than those relating to the construction of small houses.

With regard to (*a*) two sets of estimates have been considered by the Committee.

The first of the sets of estimates has been supplied by Mr. Platt, the Housing Director to the Manchester City Council. It is understood that his figures represent actual experience relative to the number of men occupied in building houses on one of the Manchester Corporation building schemes:—

THE NUMBER OF SKILLED CRAFTSMEN NEEDED TO BUILD 200,000 HOUSES PER YEAR.

Bricklayers and Masons	43,600
Carpenters and Joiners	41,200
Slaters	4,120
Plasterers	15,680
Plumbers and Glaziers	7,940
Painters	15,200
	127,740

The second set of estimates relates to the number of hours normally worked by all classes of labour in the construction of a small house. It is understood that an analysis of a large number of housing schemes carried into effect during the past three years reveals the fact that from 1,600 to 2,500 hours of labour per house represents the general range of time taken. (These figures include the hours worked by labourers as well as by skilled men.)

The Committee submit the following recommendations:—

(1) The Government should be asked to make a clear declaration of determination to carry into effect a long-run housing policy.

It will be of value in this relation to point out that the securing of an adequate number of apprentices will largely depend on:—

(*a*) The eagerness of parents to apprentice their children to the industry; and

(*b*) The goodwill of employers and operatives alike.

(2) The number of apprentices in training should be brought up to the level of a number mutually agreed upon between employers and operatives.

The following recommendations are made:—

(*a*) All builders engaged on public work, either national or local, or engaged in building houses in respect of which subsidies are given should be required, as a condition of their contract or the receipt of the subsidy, to train a specified proportion of apprentices.

(*b*) A Central Committee of Employers and Operatives should be set up and be charged with the definite duties of arranging for the recruitment of apprentices and the provision of adequate facilities for their training.

With a view to securing the transference of apprentices when work falls short or when employers may not be able to give apprentices a complete course of training it is suggested that the indentures should be between the parents on the one hand and the local district committee on the other.

(*c*) New apprenticeship schemes, the operation of which shall be limited for a certain agreed period of time, should be formed with, as their definite object:

(1) the placing aside of the present ratio of apprentices to craftsmen in favour of a new ratio to be mutually agreed upon;

(2) the training of a certain number of apprentices (whose age is greater than the present agreed age of 16) for a shortened period of not less than three or four years, the amounts to be paid by the employers to these older apprentices to be supplemented by grants made by the State;

(3) the modification of certain restrictions at present in operation governing the number of apprentices allowed to be in training under any one employer.

Recommendation (2) is put forward on the definite plea that a substantial injustice will be suffered by many of those who were of the apprentice stage during the Great War and who either volunteered or were drafted into the Army, or served in munition work during this period. It is argued that there has been quite enough suffering arising out of the war without condemning men, who would otherwise be skilled craftsmen, to remain in the position of unskilled labourers for the whole of their lives.

(*d*) Sympathetic and constructive consideration should be given to the valuable suggestion that the crafts of the building industry should be regarded as falling into four great groups or divisions, and that provision should be made for the concentration of the energy of the craftsmen coming within the limits of these four groups on the performance of work in regard to which delays in execution must seriously prejudice the activities of craftsmen in other groups.

The craftsmen of the industry fall within the following groups:—

(1) carpenters and joiners,
(2) plumbers and heating engineers,
(3) bricklayers and plasterers, masons and slaters,
(4) painters and glaziers.

With regard to group (3) it may be pointed out that already the bricklayers and masons belong to one union. There is also a strong feeling throughout the industry as to the desirability of setting up a Trowel Trade Union. In support of this proposal it may be urged with much force that in the Eastern Counties the bricklayer, in accordance with the custom of the area, does plastering work. It may further be pointed out that if bricklayers were set at plastering work it would be possible for employers in wet weather to absorb their labour in the plastering of rooms contained in houses which have already been roofed in. In submitting this suggestion the Committee clearly recognise that the work of plastering can best be done by the man who has specialised at plastering. The same truth applies in the case of the other crafts included in this group. But the Committee hold that it is clearly desirable that when the development of a housing scheme is held back because of the special shortage of one class of craftsmen included in this group, there should be a concentration of the energy of other members of the trowel trades group (even if they were less skilled in the craft which was specially short) on the task of clearing away arrears of work which, if left to accumulate, must involve the throwing of other craftsmen out of employment as well as delaying the completion of houses so greatly needed by the community.

(*e*) A system of insurance on a contributory basis or otherwise, should be set up and should provide that time lost in inclement weather should be paid for, if not in full, at least in part.

(*f*) Various improvements should be made in the status of the craftsmen and in the conditions of employment with the definite object of making the industry more attractive.

PATENTS.

APPLICATIONS PUBLISHED.*

206,380.—Waygood-Otis, Ltd., and T. H. J. Simmons: Lifts and hoists.

206,396.—J. B. Dring: Folding boxes.

206,400.—J. Birago.—Tables.

206,404.—R. Kuroshima: Folding-ladders.

206,407.—Cowans, Sheldon & Co., Ltd., and J. W. Branston: Jib-cranes.

206,414.—A. W. Nelson: Means for securing sash cords to sashes.

202,980.—O. Hartmann: Ceiling of slabs.

205,096.—Soc. Anon. la Ceramique Nationale: Apparatus for distributing the body material in the automatic manufacture of tiles.

206,894.—T. S. McCallum and Calto Co. Ltd.: Fire-places.

206,903.—C. R. Allensby and W. L. Clarke: Ovens and hot-cupboards.

206,929.—F. Bateman: Roads or the like and blocks therefor.

206,935.—W. C. Rankin: Stays for casement windows.

207,009.—W. Jones: Roof gutters.

207,020.—H. Duckworth, R. B. Duckworth and W. Duckworth: Folding-desks.

207,056.—E. Tonks & Sons, Ltd., and A. C. Tonks: Fastenings of the type known as fanlight fastenings.

207,084.—W. F. Owsley: Apparatus for levelling and surfacing plastic concrete paving.

207,110.—D. Palmer-Jones: Means or devices for connecting together members of permanent or temporary structures, buildings and scaffolding.

207,111.—E. Beckett: Concrete slab walls.

207,119.—J. C. Eccleston: Window fastener.

207,130.—E. W. Moss (J. G. Surtees): Fastening means for doors, gates and casement windows.

207,132.—D. Palmer-Jones and Scaffolding (Great Britain), Ltd.: Scaffolding or the like temporary erections.

207,209.—E. Lytton: Paints and varnishes.

207,218.—H. Howard: Wall brackets.

207,238.—E. C. Freegard: Composition of matter to be used for the removal of paint.

* All these applications are now in the stage in which opposition to the grant of Patents upon them may be made.

THE RATING AND VALUATION BILL.

The Report of the Association of British Chambers of Commerce has now been issued on the draft Rating and Valuation Bill, and after expressing approval of the course adopted of submitting a draft Bill for the consideration and comments of those whose interests are concerned, and observing that such a course must result in advantage to the community and an economy of time to the Government, it expresses approval in the main with the proposals as stated in Clause 2 of the Memorandum, and particularly as regards—(1) The simplification of the present rating system, (2) consolidation of rates where not already existing, (3) a more equitable method as to precepts, (4) a quinquennial valuation, (5) a single valuation for rates and taxes, (6) greater uniformity in valuation, (7) making the assessment committees more representative of different interests. Clause 2 of the Memorandum referred to above is entirely vague in its terms, outlining the main objects of the proposals contained in the Bill as follows: "The main objects underlying these proposals are the simplification and improvement of the administrative system of machinery of rating and valuation, and the removal of various anomalies inherent in the present system; the substitution of a single valuation in the place of the separate valuations at present required for purposes of rating and taxation; the promotion of uniformity of valuation as a condition precedent to any comprehensive review of the system of local taxation and exchequer grants."

Thus far, therefore, the report is not very specific, but it is to be noted that it accepts the principle of a single valuation for rates and taxes, and thus there seems some agreement in opinion on this point amongst the associations which have issued reports, but numerous suggestions as to how it could better be put in practice. The Landowners' Association objected to the common assessment in so far as it involved employment of officials of the Inland Revenue by a rating authority not an assessment committee (*The Builder*, January 18), and the report of the London County Council Committees objected to the gross value being made conclusive for the assessment of income tax without important modifications (see *The Builder*, February 8). The Poor Law Unions Association seemed tacitly to accept the principle (see *The Builder*, December 14, 1923).

In the report under consideration the agreement with the main objects of the Bill is at present only as above expressed in general terms; it is, however, only a preliminary report, and detailed criticism is to follow, but it is noticeable that the report expresses doubts whether the economies claimed in the Memorandum in Clause 3 in connection with the proposals outlined in Clause 2 will, in fact, be effected, especially if a new central authority has to be created.

With regard to rating, the report approves in principle the transfer of these functions to the various rating authorities as proposed in the Bill, but considers that the position of those local authorities which have already adopted similar steps should have different treatment from that suggested. As regards valuation, the report considers it questionable whether complete uniformity would produce equitable results. The report strongly disapproves of the proposed creation of a central valuation authority, on the grounds that it is (1) unnecessary, there being no justification for the abrogation of the powers of local authorities generally, who are better able to judge of local conditions; and (2) uneconomical, involving the creation of a new department and great expense and inconvenience to all concerned, but as the association recognises that railways, canals, and such parts of public utility works as pass through more than one rating area call for special treatment, it suggests: (1) that certain general principles should be laid down for the guidance of the local authorities, and (2) in lieu of the general system of appeal provided for in the Bill a special appeal body should be set up to deal with appeals against the valuation of such special properties. The report states in connection with this suggestion that the Association considers that no other departure from the general scheme of the Bill is necessary in order to produce the desired result, and that in the course of a short time it will be found that by means of these regulations and the decisions of the appeal body a uniform system of procedure will prevail throughout the country. This is a suggestion which appears to us to have much to recommend it.

It is important to note that the report adds that whatever decision may be arrived at on this question, the Association voices the unanimous feelings of the Chambers of Commerce and other important bodies that Sub-clause (i) of Sub-clause (1) of Clause 28 should be deleted from the Bill. That Sub-clause provides that "any other properties, or properties of any other class which the Minister may from time to time direct to be treated as special properties" shall be deemed to be special properties. In this connection it may also be observed that the report considers other powers conferred on the Minister by the draft Bill are too vague and extensive, and would enable him to modify and even alter the intention of Parliament, and it points out that they are contrary to the policy of decentralisation. The report also considers that it is undesirable to extend the principle of the direct rating of owners instead of occupiers.

This is only a brief summary of some of the points dealt with in this report, and, as we have said, it is stated that detailed suggestions and criticisms will be submitted later. It may have been noted that the present Prime Minister, in his interesting speech outlining the policy of the Government, stated that the present Government intended to try and deal with the subject of rating, not only agricultural rating, and that Government after Government had promised to deal with this subject, but had failed to do so, but that he hoped this Government would have time to produce its scheme for readjustment and reform in the present Parliament. It is noticeable that in this statement no mention is made of the draft Bill submitted to the country by the late Government for consideration, and which has already received such careful investigation at the hands of such important organisations. A statement on the attitude of the Government towards this Bill should be made as soon as possible, as those bodies who are giving it careful consideration and making practical suggestions for its amendment will desire to know whether in the main it is to be proceeded with or whether the Government intends to scrap it.

Industry and the Schools.

Mr. J. Murrey, National Federation of Building Trade Operatives, and Mr. R. L. Roberts, ex-Chairman of London Master Builders' Association, have accepted invitations to serve on the Central Advisory Council which the Minister of Labour is appointing in the endeavour to secure that the entrance of juveniles into industry is made under the most favourable conditions.

Building Trade Wages.

A special meeting of the leaders of both sides of the building industry was held recently in London to consider an application by the men which would have the effect of increasing the present rate of wages by 2d. an hour. At the close the following statement was issued:—

"The National Wages and Conditions Council met to-day to consider an application by the operatives for an interim variation amendment under Clause 14 (c) of the rates of the Council. After prolonged discussion the parties failed to reach agreement. Further constitutional procedure is taking place, and the matter will be considered by the executives of the adherent bodies at an early date."

THE IDEAL HOME EXHIBITION.

On February 28 the Ideal Home Exhibition was opened by the Duchess of York.

We have now so far advanced in our study of the ideal home that we are not at all surprised to find a number of full-sized cottage houses fully furnished in an "ideal home" exhibition. In some respects, we find an advance in the quality of furnishings shown, and we can imagine that the interesting full-size buildings at the present exhibition at Olympia convey a decided over-statement of what is likely to be the appearance of such buildings when they come into the possession of those who usually occupy houses of that size. The admirable examples of old furniture, such as the tiny clock on a mantelshelf at £20, and the small gate-leg table at a similar cost, are only for the fortunate few who can indulge in luxuries. Furnished with the simple austerity which limited cost necessitates, these cottages would lose some of their charm, though we could all afford to build our fire-places in a pleasanter way than the rough brick affairs which go with some of these fine old furnishing. We still, however, find many admirers of the old type of timber-framed buildings, such as Messrs. Williams & Son, of Oxted, have reproduced for us with an admirable effect of tone and colour, built up in good architectural character; and we may modify our ardour with a more modified adoption of old styles, as in the ideal home set forth by Messrs. Y. J. Lovell & Sons. Messrs. Mead's cottage is not a very happily proportioned exterior, but inside it is very attractive and contains some very admirable furnishing. One of the old half-timber cottages suggests great age and one can almost feel a thrill of age and damp in passing within its gloomy walls. Other firms show how one may keep a cottage bright and cheerful at no ruinous cost, but exhibits such as these at Olympia do not suggest to the professional mind that complete happiness and satisfaction can be standardised in style, shape and furnishing with a completely satisfactory result. Nowhere, we suppose, does the skill of a really able architect prove itself so valuable as in the handling of a small house or cottage, and probably in no part of his practice are his services so begrudged. Besides the allurement of fully furnished cottages, we find again an even greater attraction in the gardens of spring flowers produced in an excellent way by professional firms. Such an array of beautiful spring flowers is well worth seeing, and one can imagine what a splendid "draw" two or three acres of a garden like that provided would prove at the Empire Exhibition. The general effect of such an exhibition as that at Olympia is much better now than it used to be, and the draping of the roof with orange-tinted valeria produces a unity of effect which is very effective, relieved as it is with tones of blue. We do not like the silvered staircase and gilded bay shrubs, and we think the main avenue of the exhibition might easily be made a telling feature; but some day, perhaps, we shall get a really satisfactory result, such as these exhibitions suggest. Many exhibits of great excellence are to be found, such as the furnishing stands of Messrs. Heal & Son, John Barker & Co., Burnet's, Storey's, &c. In sanitary goods, such exhibits as Geo. Jennings are remarkably good; and we have never seen a more admirable exhibit as regards quality and taste than that by Bratt, Colbran & Co., of their heaped fire, and this certainly cannot be said of all such exhibits. Smith, Wellstood & Co., "The Devon" Fire, the "Interoven," and others, deserve special notice.

We give below descriptions of some of the stands:—

DECORATION AND SANITATION.

George Jennings, Ltd.

This interesting exhibit includes an example of a bathroom with fittings, designed to give comfort and efficiency, with rubber flooring (tiled in blue and white), being warm and soft to the feet. The walls are of imitation marble in white, panelled in blue, a patent composition, very effective and easily fixed, which can be supplied in any quantity or colour. The bath is in the centre of the room and is cast-iron, white porcelain enamelled inside and out. Lavatory basin and dressing table are of Venato statuary marble. Other types of baths include a new pattern white porcelain enamelled inside and out, in one piece. Labour saving fittings are represented by baths and lavatory basins fitted with china covered supply valves and special white metal alloy valves, reducing the labour of cleaning to a minimum.

G. D. Peters & Co., Ltd.

The exhibition of this firm comprises three rooms, dining room, bath room and office, all lined with "Sundeala" boards. This material is a satisfactory substitute for lath and plaster, and is used on walls, ceilings, partitions, &c. In addition to the supply of "Sundeala" sheets in plain form a number of embossed patterns are shown fixed on this Stand. Changes in temperature do not affect this type of millboard. The sheets are 11 ft. by 4 ft. 6 in. and 8 ft. by 4 ft. There are three qualities and several thicknesses.

Associated Crafts, Ltd.

"Dekart" is a material that bears a very close resemblance to oak or any other hardwood. Its initial cost is considerably less than that of the materials it is intended to supersede, being about half that of real oak. The firm undertake to carry out architects' own designs and to submit suggested schemes of treatment. "Dekart" plaster sheets, tiles and mantels are also exhibited. "Dekart," it is interesting to note, is a British product, manufactured in London entirely by British workpeople.

Ferodo, Ltd.

This firm show a full range of samples of their well-known fabric stair treads, with several models showing methods of fixing nosings and treads to various types of stairs. These treads are specially woven from cotton and treated by a process which makes them exceedingly durable and long wearing. They are supplied in various colours, which are permanent, and the material retains its non-slipping qualities and good appearance, however well worn. Samples are also shown of Feroleum nosings and flooring material, which is made from fine Para rubber and Ferodo fibre, both corrugated and plain, in various pleasing colours. Feroleum is washable, hygienic, non-slipping and long wearing.

Fortis Reinforced Concrete Safe Co., Ltd.

A new development in safe construction is in the use of reinforced concrete, and two small Fortis safes are shown of this material. They are absolutely fire-proof, and will resist the acetylene activities of the modern burglar.

LABOUR-SAVING SECTION.

G. N. Haden & Sons, Ltd.

This interesting exhibit comprises four "Eco-Dry" closets. These contain gas and electrically-heated drying cabinets. They are specially made to deal with drying in private residences, and the larger ones for drying in schools, colleges, or in connection with recreation buildings. The air is heated either by gas or electricity, and the current of air is induced by the same means, or, in special circumstances, with small fans. There is no smell or fumes in connection with these cabinets, and the drying can be done quickly and with little trouble.

Chalco, Ltd.

This firm give a demonstration of the "Challenge" patent rustless curtain runner—an exceptionally convenient and up-to-date system of hanging curtains. In the "Challenge" the curtains are hung on neat little roller-bearing runners, the frames of which are made of rustless steel. The strong flat rail is easily bent by hand to fit any shape of window, without the use of any tool. It is very easily fixed in position. Curtains hung on "Challenge" runners are on the stand, forming part of the exhibit, and ready for manipulation and test by all interested. Several other attractive and extremely useful "Challenge" home accessories are also on view, including patent stair carpet clips, patent extending wardrobe rails and hanging wardrobes.

HEATING AND LIGHTING SECTION.

The Interoven Stove Co., Ltd.

"Interoven" and "Super Interoven" convertible cooking and heating stoves (Pascall's patents) are exhibited on this stand. They are readily convertible from cooking stove to open fire sitting-room grate, and save coal, space and labour. Over 60,000 "Interovens," the manufacturers state, are now in use. Other exhibits are:—"Bewty" expanding barless fire fronts (Pascall's patent), for modernising old-fashioned sitting and bedroom grates at a small cost; and "Bewty Minor" and "Bewty" dog grates. Also "Ten-in-One" adjustable stool bottom grates (Pascall's patent) and wrought welded range boilers of every description.

Candy & Co., Ltd.

Messrs. Candy & Co., Ltd., are again showing a selection of their well-known "Devon" fires. The "Devon" fire, the makers claim, embodies all the correct principles of construction, as the back, sides and bottom are composed of specially prepared fireclay, which results in considerable fuel economy and an extensive diffusion of heat in the room in which it may be fixed. The "Devon" fire in its decorative effect has many possibilities. It can be produced to fit in with any colour scheme and with any style of decoration, two objects much to be desired thus being combined, utility and beauty. Messrs. Candy have also on show fine examples of their production in decorative pottery, which is styled "Wescontree" ware, in which variety of shape and richness of colour are prominent features.

The New Stimex Gas Stove Co., Ltd.

This firm exhibits gas cookers, ranges and circulators, which embodies up-to-date principles. The gas combination range is designed to take the place of the ordinary coal kitchener, being gas cooker, fire and circulator combined. This range is fitted with a copper circulator, suitable in any district, whether the water is hard or soft.

Thomas Potterton.

This exhibit contains a selection of the standardised types of "Victor" gas boilers, and gives a working example of a system supplying hot water for general domestic use; also an exhibit of "Thermostats" for the automatic regulation of gas consumption, both water-type and atmospheric-type, can be seen in action, and the "Victor Combination" boiler, using coke or other smokeless fuel, or gas. Standard types of sectional boilers for central heating and applied equipment are included; also water treating plants for the elimination of lime deposit and other impurities, &c.

Samuel Smith & Sons, Ltd.

The makers claim for the "Foresight" range that it cooks the food perfectly, ensures a plentiful supply of hot water at all times, enables several boiling utensils to be in use at the same time, and reduces the fuel bill by 50 per cent. It is easily and quickly converted from an efficient cooking range into an open fire. Coal consumption is regulated by automatic movable fret. The working parts cannot burn away or get out of order as they are away from the fire. The flues are easily cleaned and maximum heat in room is radiated from special all-firebrick back, substantially made to stand long and hard wear. The parts, being standardised, are easily replaced should breakage occur. Extra hot-plate and close fire is obtained by swinging the trivet over the fire.

The Cozy Stove Co., Ltd.

This firm exhibit their well-known "Cozy" open fire stoves in various types of settings. The

Nos. 10a and 20 models are demonstrated burning. The No. 20 stove can be supplied with boiler to heat a couple of radiators. These stoves are constructed in such a way that they can be installed with the front plate flush with the tiles of the surround, thus giving the impression of a nice fireplace. At the same time, arrangements can be made so that the stove will heat one to two rooms besides the room in which it is installed by means of hot-air channels in the brickwork.

Allan Ure & Co.

The "Ure" back-to-back living-room grate and scullery cooker is a very widely-adopted combination fire doing the work of two which will successfully boil and stew on hot-plate, cook a 14-lb. joint and provide a plentiful hot-water service at one and the same time. This firm are also makers of mantel registers and interiors.

The Birnwell Iron Co., Ltd.

The "Birnwell" boiler, it is interesting to note, is a British invention, is British made, and is entirely British owned. It has been designed to provide a constant supply of hot water at any hour of the day or night. Each boiler is tested to a pressure of 100 lbs. per square inch before being despatched. Every "Birnwell" stove is guaranteed against defects in material and workmanship for five years.

Triplex Foundry, Ltd.

This firm invite every housewife to see the patent "Triplex" grates at work. Nothing shown on the stand is baked outside the hall. Ladies are asked to note the large cooking over and large boiling hot chamber on top of oven. The new "G" pattern has been specially designed to provide cooking accommodation for more than average requirements and the slightly larger fire to meet a demand for this in the north country. The "Workwell" grate is designed to give the working man's wife a thoroughly good cooking oven and an abundance of hot water, with economy. All who are interested in housing schemes are asked to inspect this practical grate.

W. H. Gaze & Sons, Ltd.

Gaze's are exhibiting in miniature their "All-weather" hard tennis court. The first British Hard Court Lawn Tennis Championship is being played in April next on "All-weather" hard courts at Torquay. Messrs. Gaze are also exhibiting garden figures and ornaments, in lead, old stone, &c. A fuller range of these figures can be seen at The Gazeway, Portsmouth-road, Surbiton; and tennis courts can be played upon, by appointment, at this address.

BOOK REVIEWS.

Spon's Architects' and Builders' Pocket Price Book for 1924. Edited by CLYDE YOUNG, F.R.I.B.A. Fiftieth edition. (London: E. & F. N. Spon, Ltd., 57, Haymarket, S.W. 1.)

This work, as its title indicates, is produced in a handy form, and contains a great deal of information in small bulk. It bears evidence of a certain amount of revision in the bulk items, but in certain smaller ones there is evidence of a little slackness, *e.g.*, while reduced brickwork in stocks is priced at £39 per rod, say, 2s. 10½d. per ft., lower down on the same page the brick walls are priced at 1s. 8d. per ft.; whereas on the same basis as bulk brickwork it should be 1s. 11d. without any allowance for the extra cost of less thickness. This remark also applies to the half-brick walls, so far as the extra cost last mentioned. It is difficult to understand why the extra cost of cement over lime-mortar should, in the case of stock brick-work be £2; in Fletton's, £1 10s.; and for the item of labour, mortar and scaffolding, £3. These may be small matters, but are inconsistencies to be avoided in a work of this class. The day-work prices for lead are lower than the purchase price has been for some six months past. Some of the prices are extremely low, notably stonework and granite sett paving.

Laxton's Builders' Price Book. (London: Kelly's Directories. Price 7s. 6d.)

Laxton's Builders' Price Book (1924) is a distinctly up-to-date publication, and keeps well abreast of the latest improvements in all matters relating to building construction.

Among the many good features in this edition we note that a very useful section on "Piling to Foundations and Riverside Structures" has been added (pp. 17 and 18). The chapter on reinforced concrete has itself been "reinforced" by a number of additional examples (pp. 40 to 45), and we appreciate the improvement effected by bringing together in one group asbestos manufactures of all kinds, with considerable advantage to clearness and handiness of reference (pp. 118 to 127).

It would be difficult to mention any article or material required in building which does not find mention in the many pages of this work.

Its arrangement is clear, its matter is good, and while conducted on its present lines its success is assured.

New Premises for Messrs. Woolworth, Oxford Street, W. (*See p.* 377.)

[From a photograph taken on February 12.]

Plumbing: A Textbook for Craftsmen. By ERNEST G. BLAKE, M.R.S.I. (Crosby Lockwood. 2 vols. Price, 6s. each.)

These textbooks are well printed, amply illustrated, and indexed. The title-page states that the books are based on a work of the same title by another author. Presumably some old illustrations have been used and those for cast-iron gutters and roofs are not quite the modern practice. Illustrations of sections of gutters at present on the market would have been more useful. An example shown (Fig. 112) of lead covering to hatch would hardly prevent percolation of water. There are chapters dealing with rain water, pumps, hydraulic rams, and drainage and ventilation. A work of this description should have shown the more recent patterns of cast-iron inspection chambers to drains.

Vol. 2 deals with soil and waste pipes, sanitary fittings, hot-water supply, wash-houses and laundries, and gas fires and boilers. The chapter on waste-preventing cisterns gives a clear account of those in common use, but some hints as to the disadvantages and difficulties experienced with the different kinds when in use would have been of value. The tip-up lavatory basins shown (Fig. 77) are now rarely fitted in good class work. An air pipe is shown (Fig. 105) off trap to sink, and if this is meant to indicate a "puff" pipe, it is a practice which is rapidly becoming obsolete.

Heating arrangements for small domestic systems are dealt with, and it is suggested that the boiler to kitchen range should be cleaned "at most" every two or three years; annual cleaning would be the safer recommendation. In a book of this kind one would hardly expect to find such a large subject as gas stoves and gas boilers exhaustively treated, but hints as to the difficulty of cleaning out some kinds of gas boilers should have been mentioned.

The Housepainter's Handbook. By JAMES LAWRENCE. (Manchester: The Decorative Art Journals Co., Ltd.). Price 5s. net.

This book is admirably summed up in its title. It is actually a small, neat, concise book crammed with information, and containing the essentials of painting-trade practice. Seeing, however, that there is already at least one book on the market which has precisely the same aims and purpose, the need for yet another is questionable. The book includes, in addition to notes on colours, colour-mixing, &c., information as to measuring and pricing, care of brushes, various useful talks, and a dictionary of painters' and architectural terms. There is also a very good Roman alphabet; but for the most part the illustrations are of doubtful value. The church borders, for example, are of the kind that might well deter sensitive men from attending divine service. The value of the book would, we think, have been increased had it confined itself to statements of fact and not included designs for church decoration, frieze panels, stencilled ceiling corners, and the like, which, fortunately, few house painters are called upon to provide.

International Garden Cities and Town Planning Federation. Report of Conference at Gothenburg, 1923. Report No. 5.

This report includes accounts of housing progress in seventeen different countries since 1918, together with numerous papers dealing with different aspects of town planning contributed by experts, including Mr. Raymond Unwin and Mr. G. L. Pepler. The English report was presented by Dr. I. G. Gibbon, of the Ministry of Health, and among his observations he remarks that the reason we still have no law enabling local authorities to plan built-up areas is largely because there is as yet no serious demand for it by public opinion, "and it is not our practice to pass laws unless there is behind them a public opinion to make them effective." This principle is sound in theory, but in practice it too often means that the Government tolerates obvious evils rather than gives alead in the right direction. Not the least pleasing side of this report is the evidence it gives of increasing international co-operation in the great twin problems of town planning and housing, which are all pressing equally over the world.

NEW BUILDINGS IN LONDON.

Oxford-street.—Reconstruction.—The premises of Messrs. Raoul's Shoe Co., 240, Oxford-street, are now being reconstructed by Messrs. Higgs & Hill, of Crown Works, South Lambeth-road, S.W.8. The reconstruction includes a marble front by Messrs. Jenkins, of Torquay, and metal work by Messrs. Pirie; Messrs. Waygood Otis, Ltd., are carrying out the lift work. The architects for the work are Messrs. Romaine-Walker & Jenkins.

Waterloo-road.— Alterations.— Alterations are now being carried out by Messrs. J. Parsons, of 190, Waterloo-road, at 117 and 119, Waterloo-road, for Messrs. Barclay's Bank, Ltd. The work consists of altering the ground floor and basement. This work will cost £1,851. The sub-contractors are: Cast stone front, by G. Seale & Sons, of Lomond-grove, S.E.; embossed glass, by W. Gibbs & Son, Union-street, S.E. Mr. V. Vagnolini, of 33, Stirling-road, Clapham rise, is the architect for the work.

Notting Hill Gate.—Remodelling.—All the work in connection with the structural alterations and remodelling of the Linden Gardens Hotel is being carried out by G. H. Carter, Ltd., of Holloway, N.7. Messrs. Smith, Major & Stevens are installing an electric passenger lift.

Clapham-road.—Reconstruction.—The premises of the Royal Association in Aid of the Deaf and Dumb, Clapham-road, S.W., are being reconstructed by Holloway Bros., Ltd. The sub-contractors for the work are: Fireproof floors, &c., Homan & Rodgers; heating, Henry Hope & Sons; metal windows, Crittall Manufacturing Co., Ltd. Mr. E. Maufe, of 3, Raymond Buildings, Gray's Inn, W.C., is the architect for the work.

Wembley.—Shops.—Messrs. G. H. Carter, Ltd., of Holloway, N. 7, have had their tender accepted by the Wembley Park Estate for the construction of reinforced concrete foundations and the erection of four shops. The architect for this work is Mr. E. J. W. Hider, M.S.A., Avenue-chambers, W.C.

Regent-street.—Building.—A new building is now being erected at 169–173, Regent-street, for the American Shoe Company, under the supervision of Messrs. Yates, Cook & Darbyshire; Mr. J. T. R. Wildman is the quantity surveyor. The building has an entire Portland stone front, and is a steel frame building; part will be used as showrooms for the company, and part of the ground floor and basement for the Burlington Restaurant. The upper portion of the building it is intended to let as business offices. The cost of the contract is approximately £60,000. The construction comes under the Steel Frames Act, and the reinforced floor contract has been let to Diespeker, Ltd., the steelwork being in the hands of the Aston Construction Co., Ltd. The stonework contract has been let to the Metropolitan Stone Co., and the granite to Brookes, Ltd. The asphalte has been let to the Ragusa Asphalte Co.; no other contracts have been arranged at the moment. The Monnoyer British Construction Co., Ltd., are the builders.

Tottenham Court-road. — Extension. — The North British Rubber Company are having an extension made to their premises, at 200–203, Tottenham Court-road, which will be faced with Portland stone. The floors are of steel and concrete construction; cast iron sashes, panels, and mullions from Macfarlane's foundry. Messrs. Moreland, Hayne & Co. are the contractors for the steelwork. The lifts and lighting will be carried out by the Berkeley Electrical Engineering Co., 10, Davies-street, Berkeley-square, W. Mr. F. G. Minter, of Ferry Works, Putney, is the general contractor.

Houses for Guildford.

In reference to the tenders for twenty-nine pairs of non-parlour houses for Guildford, given in our issue of last week, the prices quoted are for single houses.

RATES OF WAGES IN THE BUILDING TRADE.

The following are the rates of wages in the building trade in England and Wales. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur:—

	Masons.	Bricklayers.	C p'ters Joiners.	Plasterers.	Slaters.	Plumbers.	Painters.	Labourers.

(For rates of wages in the Building Trade in Scotland, see page 400).

CONTRACTS, COMPETITIONS, &c.

Forsome contracts still open, but not included in this List, see previous issues. Those with an asterisk are advertised in this number. Certain conditions beyond those given in the following information are imposed in some cases, such as that advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in; the name and address at the end is the person from whom or place where quantities, forms of tender, &c., may be obtained.

✱NO DATE.—**Weston-super-Mare.**—Architectural Assistant wanted at once, with experience in town-planning work. Temporary appointment. Mr. Harold A. Brown, Engineer and Surveyor, Surveyor's Office, Town Hall, Weston-super-Mare.

A Squash-Rackets Court.

A squash-rackets court, which can be erected in a very small area, has been designed by Messrs. G. H. Carter, Ltd., of 108, Hungerford-road, N.7, and one has already been installed at the Cavendish Club. These courts have brick walls covered with a special hard and moisture-absorbing self-coloured composition, the uniformity of which gives consistent speed in play. The lighting arrangements are also uniform, with an absence of glare. It is claimed that the elastic and non-slippery nature of the floor does not tire the players, and that the total cost of installing the court is small.

TRADE NEWS.

Builders' Lorries.

The lorry illustrated below was recently built by Messrs. Leyland Motors, Ltd., to the order of Messrs. Howell J. Williams, Ltd. The chassis is a standard three-ton model, fitted with 30-32 h.p. engine. On this is mounted a special frame-sided body, the sides being 18 in. high. For carrying long timber it is fitted with a forward gantry to protect the cab. This gantry is constructed of angle iron, the sides projecting 18 in. above the crossbar to prevent lateral slipping. The central bolster is constructed in trestle form,

secured to the floor with four iron brackets; it is thus easily removable in case of uninterrupted loading space being required.

Sell's Directory.

We have received from Messrs. Sell's a copy of their Directory for 1924 (thirty-ninth year). The volume contains the names, alphabetically arranged, of some 100,000 firms in Great Britain and Ireland, together with their postal address, telephone number, trade or occupation, and registered code word. A Trade Section is included in each volume, where the name and address of some 130,000 firms are classified under 3,500 trade headings. A new departure of interest to the building trade is to be found in a separate section in the volume, entitled Sell's Building Trades List, which gives, under some 500 trade headings, the names and addresses of the leading firms engaged in the building and allied trades in Great Britain and Ireland, together with special announcements of firms giving particulars of their business.

New Woolworth Building.

Messrs. Banister, Walton & Co., Ltd., possessing extensive works, well equipped with modern plant and appliances, executed their portion of this work in record time. Among several substantial contracts which Messrs. Banister, Walton & Co. have in hand there is the new office building in Manchester for the Bleachers' Association, Ltd.

They also, of course, recently completed the new Woolworth Buildings in Liverpool.

PROPOSED NEW BUILDINGS & OTHER WORKS.*

In these lists care is taken to ensure the accuracy of the information given, but it may occasionally happen that, owing to building owners taking the responsibility of commencing work before plans are finally approved by the local authorities, "proposed" works at the time of publication have been actually commenced. Abbreviations: T.C. for Town Council; U.D.C. for Urban District Council; R.D.C. for Rural District Council; E.C. for Education Committee; B.G. for Board of Guardians; B.C. for Borough Council; P.C. for Parish Council; M.H. for Ministry of Health; M.T. for Ministry of Transport; and B.E. for Board of Education.

ABERAYRON.—Capt. Evans, Llyswen, is to erect eight houses.

ACCRINGTON.—Alternative plans for the erection of a new pavilion and shelter at Oak Hill Park have been submitted by the Borough Surveyor, and he has been instructed to proceed to carry out one of brick rough cast estimated to cost £600.

ALDERSHOT.—Plans passed by T.C.: House, Cranmore-lane, for Mr. J. Levitt; lavatories, &c., at Assembly Rooms.

ASHTON-IN-MAKERFIELD.—Plan was approved of a proposed lay-out of streets in Gaswood Park, between Liverpool-road and Warrington-road, for the Gaswood Estate.

BEDDINGTON.—Plans passed by U.D.C.: Two houses, Croydon-road, for Mr. W. H. Upson; bungalow, Stafford-road, for Mr. E. M. Swabey; two houses and shops, London-road, for Mr. J. J. Kent.

BEDFORD.—Plans passed by R.D.C.: House and shop, Bromham, for Mrs. Webster; bungalow-shop at Chawston, for Mr. H. A. Sanders.

BENFIELDSIDE.—Application has been made to the U.D.C., with respective specifications, by the Consett Iron Co., in respect of 70 houses on the Highgate Estate; one cottage in Consett Park, and 20 houses in Durham-road, Blackiyne.

BILLINGHAM.—The U.D.C. have passed plans for the erection of eight houses in Station-road, for Mr. H. Scotson.

BISHOP AUCKLAND.—The Durham C.E.C. have resolved to ask the B.E. whether they are prepared to consider plans for the construction of a new Grammar School, at an approximate cost of £20,000.

BLEYDON.—Plans passed: Messrs. J. E. & L. E. Hetherington, Newcastle, additions to Wesleyan Chapel, Winlaton; Mr. Henry Bowers, for 20 bungalows at Rowlands Gill; Mr. G. C. Johnson, seven houses at High Spen.

BOLTON.—Plans passed by T.C.: W. Orrell, four houses, Holden-avenue; Knowles, Ltd., pavilion, Church-road; B. T. Saunders, house, Church-road; Hooton & Rigby, three houses, Abbotsford-road; N. Critchley, house, New Church-road; R. Young, house, St. Michael's-avenue; Thos. A. Scowcroft, house, Green-lane; Leigh Bros., Ltd., 10 houses, Alexander-road; W. Reddyhough, four houses, Regent-road; A. Fenton, two houses, Withins-lane; Horrocks & Andrews, two bungalows, Wheatfield-street; E. A. Le Gendre Starkie, new streets, off Colenso-road; Earl of Derby, new street off Bury-road; J. Archer, bungalow, Withins-lane; C. Reddyhough, billiard hall, Gibbon-street; Morris & Owen, two houses, Withins-lane; J. Latham, two houses, Regent-road; Wilfred Johnson, for extension to premises, Market-street; Leigh Bros., Ltd., for four houses and shops, two semi-detached villas, Chorley Old-road; W. W. Pickup, 10 houses, Roland-road; R. Shippobottom, for house and shop, Hughes-street.

BOURNEMOUTH.—Plans passed by T.C.: House, Clarence Park-road, Mr. A. Scott; house, corner of Pine-avenue and Stourcliffe-avenue, Mr. E. R. Saunders; house, corner Boscombe Overcliffe-drive and Dingle-road, Mr. R. J. M. Nabney; house, St. Ledger's-road, Mr. C. V. Miller; two houses, Burleigh-road, Mr. M. Sellick; house, Namu-road, Mr. W. Stark; five houses, Elmes-road, Messrs. Jones & Sims; house, 32, Iddesleigh-road, Mr. J. South; house, St. Luke's-road, Mr. A. Barnes; house, Bethia-road, Miss E. M. Southgate; house, King Edward-avenue, Mr. G. Jones; house, College-road, Mrs. M. Carnegie; two houses, Carbery-avenue, Mr. J. Scott; two houses, Glenmore-road, Messrs. F. W. Burton & Sons; house, Chigwell-road, Mr. C. Newton; house and garage, Seafield-road, Mr. W. Hoare; two pairs of houses, Section A, Shirley-road, Mr. J. Drewitt; house and garage, Pinecliffe-avenue, Mr. C. F. Gowlland; house and garage, Dingle-road, Mr. R. J. M. Nabney; house and garage, Grand-avenue, Mr. R. J. M. Nabney; house, Harewood-avenue, Messrs. Midgley & Hardy; house, Watcombe-road, Mr. H. Filmer; house, Danesbury-avenue, Mr. H. Hewitt; house, Watcombe-road, Mr. A. Williams; house, Irving-road, Mr. A. Barrett; house and garage, Belle Vue-road, Mr. G. B. Barnes; three houses, Court-road, Mr. W. Moore; house, Chessel-avenue, Miss Sutcliffe; house, Irving-road, Mr. R. C. Slingsby; two houses, Sutton-road, Mr. R. Vickers; two houses, Green-road, Mr. G. C. Roberts; two bungalows, Namu-road, Mr. G. H. Burt.——In connection with the Pavilion Scheme, the Pavilion Committee recommends that tenders be invited for clearing the site of existing buildings. — The Christchurch B.G. has decided to make application to the M.H. for sanction to expend some £6,000 in enlarging the nurses' home at the Institution, and £785 in respect of the extension of the aged women's quarters.—The Council is applying to the M.H. for sanction to a loan of £4,500 for subsidies for 60 houses. A tender of £1,350 per block for seven blocks each of four houses is to be accepted, subject to approval of the M.H., which is to be asked to sanction a loan of £10,000 for the purpose.—The Bournemouth E.C. is asking the B.E. to approve the enlargement of the Stourfield Council School by an additional block of buildings; and the T.C. is to be asked to obtain the necessary sanction for a loan of £1,464 for adapting Lowther-road Hospital as a secondary school.——Mr. P. M. Crosthwaite, an inspector under the M.H., has held an inquiry into the application of the T.C. to borrow £30,000 for the construction of a new sewer outfall at Southbourne.

BRADFORD.—The City Council has decided to carry out a scheme of alterations to Usher-street School and Sandy-lane School, by making the former into four separate dwellings and the latter into three separate dwelling houses.——An important scheme is also to be carried out at the junction of Manchester-road and Little Horton-lane.

BRIDGEND.—The Council is to put in hand immediately work of constructing two foot bridges to recreation ground and will borrow £1,000, the sum estimated to be cost of construction. Other U.D.C. schemes, with estimates of cost, to be proceeded with shortly are Litchard sewer, £2,425; Brynteg sewer, £510; and Glanogwr sewer, £2,000 to £3,000.

BRIDLINGTON.—The M.H. has intimated that he is prepared to issue a provisional order for the extension of the Royal Prince's-parade, and for acquiring certain properties in connection therewith.

BRINSLEY.—Notts E.C. has approved of additions to the Council School, estimated to cost £2,100.

BROMLEY.—Plans passed by R.D.C.: Mr. E. C. Woods, house, World's End-lane, Chelsfield; Mrs. A. L. Summers, house, Footbury Hill-road, Orpington; Mr. J. Kent, three new streets, Grosvenor-road, Elysian-avenue, and Sutherland-avenue, Ladywood Estate, Chislehurst-road, Orpington; Mr. G. Williams, house, Crofton-lane, Orpington; Mrs. L. E. Murphy, bungalow at Strathcona, Sutherland-avenue, Cudham; Mr. J. W. Beagley, bungalow, Norheads-lane, Cudham; Mr. V. Bendall, bungalow, Village Green-avenue, Cudham; Mr. C. N. Cubitt, house, Barnet Wood-road, Hayes; Lord Avebury, conservatory, High Elms, Downe; Mr. E. Morris, bungalow, Main-road, Leeson's Estate, St. Paul's Cray.

BURNHAM-ON-CROUCH.—Messrs. Howes & Belcher, architects, of Westcliff, have forwarded to the U.D.C. a plan showing the suggested lay-out of the land on the river front to the west of Burnham, which Burnham Estates, Ltd., have acquired from the executors of the late Mr. B. Weekes. The company propose to build houses of a fairly good class on the river front, to sell at about £1,000 each, and to build houses, with large gardens, on the back land to sell at about £650 to £750.

BURNLEY.—The T.C. has been recommended to extend an improvement scheme at Glen View-road as far as Reynolds-street, at an estimated cost of £1,800. It is subject to a grant of 60 per cent. towards the wages' bill of unemployed men take on for the works.

BURY.—There has been a revival of the question of the erection of a town hall for Bury. The matter has been discussed by the Parliamentary, Furnishing, &c., Committee.

BUXTON.—Considerable extensions are proposed to the "Cat and Fiddle" Hotel to provide accommodation as a residential hotel.——The Bench has approved the plans for the proposed alterations to the Devonshire Hotel, submitted by Mr. H. R. P. Lomas.

CAERPHILLY.—The U.D.C. has agreed to terms for land acquisition for the purpose of erecting new Council offices and other public buildings.

CARMARTHENSHIRE. — The County Education Authority is to erect new school for 400 children at Llangennech.—The Lampeter Council is considering a comprehensive water supply scheme.

CASTLEFORD.—Plans passed: Two bungalows, Wheldon-lane, for the Yorkshire (West Riding) Tramways Committee; four houses and lock-up shop, Leeds-road, Castleford, for Mr. L. J. Gallagher; house, Smawthorne-lane, for Mrs. Belwood; house, St. Helen's-place, for Mr. H. England; slaughter-house, making-up room, &c., off Carlton-street, for the Castleford Co-operative Industrial Society, Ltd.

CHEADLE.—The U.D.C. has passed plans submitted by H. Simon, Ltd., for new works; and by the Oil Well Engineering Co., for an extension of works.——Mr. G. Westlake has submitted a plan of the lay-out of the Highgrove Estate.

CHESTERFIELD.—The Improvement Committee have approved the lay-out plans of the site and detail plans of buildings on the Chester-street town-planned area, in connection with the scheme of the Chesterfield Miners' Welfare Fund Society. The buildings will be of one story, and the principal will be a lecture hall to seat 350. In other parts of the institute will be a billiard-room, smoke-room, games-room, and reading-room. The main entrance will be in Ashgate-road, but the institute will abut upon a new road, to be named Springfield-avenue, giving direct communication with the Brampton district.—It has been decided to carry out a scheme of extension to the Royal Hospital with a new wing, which will comprise a new ward.——An annexe is to be added to Holywell House to accommodate the additional nursing staff, and the main kitchen is also to be enlarged.

CHORLEY.—The B.G. has decided to erect a mortuary at an estimated cost of £500.

CLITHEROE.—A plan of a bungalow to be erected near Chipping, for Mr. F. Hoyle, was approved by the R.C.

CONSETT.—The U.D.C. is proposing to obtain sanction from the M.H. for the erection of an additional 100 houses. The Council's architect, Mr. F. A. Coyle, has prepared plans and specifications for the houses, which are to be built at a low figure, the smaller type being estimated at £288 and the larger type at £335 each.

CROYDON.—Plans passed by T.C.: F. W. Cattermole, eight houses, and four houses and garages, Stanford-road; R. Weller, seven houses, Waddon and Courtney-roads; Holborow & Son, two houses, Pollards Hill South; F. Windsor, house, Manor Way; C. S. Banks, six houses, Morland-road, next No. 223; F. Robinson, two houses, Whitehorse-lane; T. H. Burgess, 10 houses, Grecian-crescent; Clout & Tysoe, 18 houses, Mayfield-crescent and Mayfield-road; F. H. Willcocks, two houses, Pollards Hill South; Paish, Tyler & Crump, two houses, 34 and 36, Selwood-raod, two houses, Fryston-avenue, and four houses, Addiscombe-road; J. Larner & Sons, converting house into two maisonettes, 260, South Norwood Hill; S. H. Laver, three shops, London-road, Norbury, 1 to 3, College Parade; S. Jefferis, 12 houses, Livingstone-road; L. White, seven houses, Totton-road; S. H. Palmer, store for builders' plant, Cliffe-road; J. S. Campbell, mess and packing rooms to laundry, 120, Selsdon-road; G. Bland, 12 houses, Limpsfield-avenue; Young & Macintosh, 24 houses and 23 garages, The Chase, Norbury; A. E. Stanger, house, Crown-lane. — The Housing Committee is promoting a new scheme for building cottages on its estate of 60 acres at Waddon, which was acquired.

DARLINGTON.—The R.D.C. have approved plans submitted as follows: Twelve houses at Barmpton-lane, and four houses at Whinfield, for T. E. Dougal; two houses at Neasham-road, for J. W. Redford; bungalow, for A. G. Cramp; two houses at Middleton-one-row, for J. W. Richardson; two houses at Denton, for Lord Barnard; 12 houses at Middleton St. George, for Mr. J. F. Bainbridge; bungalow at Yarm-road, for T. Turnbull; bungalow at Yarm-road, for A. Graham; two houses at Yarm-road, for H. Blackett; house at Station-road, Hurworth, for J. Smith; and four houses at Station-road, Fighting Cocks, for G. M. Graham.——The E.C. have received sanction from the M.H. for the appropriation of a site at Cockerton for the purpose of erecting a public elementary school.——The B.G. has decided to extend the Nurses' Home.

DERBY.—The E.C. is asking the T.C. to sanction plans for a new school on the Nightingale-road site.

DEWSBURY.—The Education authorities have decided to proceed with the erection of a new elementary school at Myrtle-road, Ravensthorpe.

DONCASTER.—The Brodsworth Main Colliery Co. has commenced operations with the erection of 550 houses on the Doncaster house site at Woodlands Model Village.

DUDLEY.—Plans passed by T.C.: Mr. D. Jakeman, two houses, Stourbridge-road, Scotts Green; Messrs. J. Duffy & A. E. Darby, two houses, Westley-street; Mr. James Dunn, bungalow, Gammage-street.

DUNDEE.—Plans and sections of proposed new buildings, &c., have been lodged at the office of the City Engineer: Glamis-road, house and garage, for W. Stirling Draffen; Lochee-road, institute, &c., for J. Sharp & Sons, Ltd.; Macdonald-street, governor's house, for the Dundee Gas Commissioners; Magdalen Yard-road, additions for the Managers of the Dundee Royal Institution for the Blind.

EARLESTOWN.—The vicar and wardens of St. John the Baptist's, Earlestown, were granted a faculty to complete the church by the addition of one bay and a tower, with bells and clock, at the west end. It was not intended to proceed at present with the erection of the tower beyond the height of the nave. The work now to be put in hand will cost from £3,500 to £4,000.

EASINGTON.—The B.G. are preparing a scheme for the erection of a new nurses' home.

EASTBOURNE.—The R.D.C. has granted a subsidy in respect of six houses to be erected by Mr. J. T. Wenham, at Priory Orchard, Langley.

EDINBURGH.—The Dean of Guild Court have passed the following petitions: Miss K. B. Anderson, bungalow at Woodhall-road, Colinton; G. W. Campbell, two semi-detached houses at Ainwickhill-road; T. S. Henderson, three bungalows at Blackhall; J. M'Gavin, three bungalows at Templeland-road, Corstorphine; Wm. Stewart, double bungalow at Riversdale-road, Corstorphine; R. A. Wilson, bungalow at Hyvot's Bank, Gilmerton; T. Young, bungalow at Saughton-road, Corstorphine; R. W. Forsyth, Ltd. extensive new buildings at 31-32, Princes-street and 3, St. Andrew-square.

EDMONTON.—A proposed lay-out plan for 250 houses at Park-avenue and Village-road, Bush Hill Park, has been approved by the U.D.C. The plan was deposited by Mr. L. Brown, on behalf of Mr. G. H. Stacey. Another plan deposited by the same gentleman, for the erection of 50 houses by Mr. Stacey, in the roads mentioned, has been passed also.

EPSOM.—The Council has provisionally agreed to erect 74 cottages in various parts of the area.

FELTHAM.—The Middlesex C.C. intends to provide a new school for 400 children.

FLANDERWELL.—The Dalton Main Colliery has decided to build 200 houses at Flanderwell on a site bordering the Dalton Brook, Ravenfield and Bramley parishes.

FOLESHILL.—Plans passed by R.D.C.: G. Pickering, 8 houses at Bedworth.

GLAMORGAN.—The Port Talbot B.C. Highways Committee recommends the Council to erect beach shelters to accommodate 1,000 people.

GLOSSOP.—Plans passed by T.C.: Pair of semi-detached houses, Newshaw-lane, for Mr. G. Guthrie and Mr. Albert French; pair of semi-detached houses, Ashes-lane, for Mr. Samuel Goddard.

GREASBOROUGH.—The U.D.C. has decided to seek the sanction of the M.H. to a loan of £6,800 for works in connection with the provision of the new sewage works to serve the village, and the Mangham area.

GREENOCK.—The Governors of the Ebe Infirmary have decided to proceed with the £5,000 extension scheme.

HARTLEPOOL.—Plan passed: Fitting shop and offices, for Irvine's Shipbuilding and Dry Docks Co.

HASLINGDEN.—Application has been made to the M.H. for sanction to the conditional purchase as sites for houses of land near Whitlet-street, the old football field, and land at Rising Bridge.

HEMSWORTH.—The M.H. has authorised the R.D.C. to proceed with the erection of a further 100 houses.

* See also our List of Contracts, Competitions, etc.

HURSLEY.—Plans passed by R.D.C.: House, Kiln-lane, Otterbourne, for Miss Lovegrove; house, Shaftesbury-avenue, Chandler's Ford, for J. W. Mann; house, Shaftesbury-avenue, Chandler's Ford, for W. Harris; house, North End, Chandler's Ford, for W. Bendell; house, Southampton-road, Chandler's Ford, for G. G. Edwards; bungalow, Baddesley Common, for J. Bishop.

ILFORD.—Plans passed by U.D.C.: Milbourne & Co., two houses and garages, 96-98, The Drive; E. Meredith, house and shop, Becontree-avenue; D. J. Barwell, six houses, 40-50, St. Luke's-avenue; Cottee & Parker, two houses and garages, 28-30, Wards-road East; Mrs. M. A. E. Jay, house, "The Billet," Longbridge-road; L. Jones, house and garage; Greenhill-road, for Roberts & Sloss, 10 houses; Whitehedge-road, for J. W. Griffiths, three houses; Warnerville-road, for Serrett & Davies, four houses; Stanley-gardens, for W. H. Furphy, 52 houses; Queen's-drive, for J. R. Ruddock, 10 houses; Derby-lane, for J. R. Ruddock, 14 houses; Corinthian-avenue, for J. R. Ruddock, 11 houses; Florantine-road, for J. R. Ruddock, 32 houses; Pallaviz-road, for J. R. Ruddock, 7 houses; Dacre-road, for J. R. Ruddock, 10 houses; Cornice-road, for J. R. Ruddock, three houses; Orchard-lane, for R. Musgrove, two houses; Whitehedge-road, for Hugh Hughes, 22 houses; Grey Drive-road, for W. Cousins, house; Garden-lane, for V. Porter, four flats; Silver Beach-avenue, for J. Darcy & Son, six houses.

LLANDUDNO.—The Board of Management submitted plans for extension and reconstruction, which would cost nearly £7,000, and provide room for seventeen more beds. The proposal was unanimously agreed to.

LLANELLY.—The B.C. has in consideration the following schemes:—Erection of school clinic, maternity home, public slaughter-house, erection of new school at Llanerch, improvement of Thomas-street.

LONDON (WOOLWICH).—The Commissioners of His Majesty's Works have decided to purchase land on the East Wickham Building Estate, Churchfield, and Lodge-lane, for the purpose of housing workers in the Arsenal.

LONDONDERRY.—The Committee of Management of Londonderry City and County Infirmary proposes to build an additional wing to the institution. The nurses' quarters will be enlarged so as to provide accommodation for the matron and twenty-five nurses, as well as the domestics. This will occupy the two floors, and the third floor will be used as private wards, containing a hundred beds.

LYTHAM ST. ANNES.—The Parks and Pleasure Grounds' Committee have considered the question of developing the land adjoining the Fairhaven Lake.

MANCHESTER.—The Manchester Parks' Committee have decided to erect bowl-houses and tennis pavilions, &c., at Broadhurst Park, Green Bank Park, Debdale Park, Bradford Recreation Ground, Chorlton-cum-Hardy Recreation Ground, Platt Fields, and a boat-house at Platt Fields, at a total cost of £11,345.

MERTHYR TYDFIL.—The B.C. has decided to apply for grants to carry out the following works:—(1) New road from Brynteg to Queen's-road; (2) connecting road between Winchfawr and Aberdare-road. The estimated cost of two schemes is £1,850. The Council will also embark on following works:—(1) Road widening on main road Merthyr Vale to T.V.R. station; (2) widening of main road at Fiddler's Elbow, Quaker's Yard, and (3) erection of new bridge over Taff river at Pontyrhun, Troedyrhiw.—The Council has called for estimates of a housing scheme for Dowlais district.

MONMOUTHSHIRE.—The Bedwas and Machen U.D.C. has received plans for houses to be erected by the Bedwas Navigation Colliery Co. for its workmen.—The Tredegar Council has approved plans submitted by Mr. W. Edgar Jones for proposed new institute and workmen's hall, to be erected by the Glanhowy School.

NEWARK.—The T.C. has decided to carry out a very important improvement scheme at the junction of the five cross roads at Beumond Cross. The adjoining property has been acquired and will be demolished to permit of the new curb line being set back a considerable distance.

NEWCASTLE.—With a view to completing two sections of the Walker Estate, the Housing Committee are recommending the City Council to invite tenders for the erection of 142 houses, and that these be obtained at a price not to exceed the housing architect's estimate of £59,816. They are also recommending the securing of tenders for roads and sewers, which are still uncompleted.——The B.E. has intimated to the E.C. they can proceed with the immediate erection of the Heaton Secondary School for 500 boys and 500 girls. The scheme will involve an expenditure of about £80,000.

NOTTINGHAM.—The Public Libraries and Museum Committee of the T.C. are recommending the erection of two new public branch libraries, one at Vernon Park, Basford, and the other for the Radford and Lenton districts, the estimated cost of both is £16,514.——It is also proposed to erect new public baths at Radford, constructed to permit of conversion into a public hall, estimated cost £7,700.——The E.C. has approved of the following: Two additional class-rooms at Haggonfields C. School, Worksop, at an estimated cost of £9,080.

OLDHAM.—Reconstruction, alteration and extension of accommodation in connection with the public lavatories in Market-place, Oldham, is projected by the Carrying and Cleansing Committee, at an estimated cost of £3,000. The Surveyors and Buildings Committee considered plans for 50 houses proposed to be erected at Greenacres. The Oldham Industrial Co-operative Society have in view the erection of a new roof on the Co-operative Hall and the extension of the premises across Marsland-street.

PEMBROKESHIRE.—The R.D.C. has submitted for approval and grant road schemes estimated to cost £2,875, and has applied for separate loan to proceed with reconstruction of Milford-Neyland road.

PRESTON.—In order to straighten out the awkward dog-leg turn in the new arterial road at Deepdale-road, Preston, the Corporation have decided to remove the existing lodge of the isolation hospital and set back the boundary of the hospital grounds in line with the northern boundary of the road. A new lodge and gates will be erected in the hospital grounds.—The Lancashire C.C. has been authorised to make provision for a new church, at a cost of between £3,000 and £4,000.—The Members of the Woodplumpton and District Village Club are proposing extensions to the club premises.

PORTSMOUTH.—A proposal to establish a cripples' hospital for the borough is under consideration, the idea being either to build an addition to the Royal Portsmouth Hospital or to erect a separate building on Portsdown Hill.—The B.C. is to widen the London-road by purchasing property from the War Department, the cost being estimated at £10,000, which the M.H. is to be asked to sanction.——The Beach Committee is considering the erection of one-roomed bungalows facing the sea on land near Southsea Castle and Clarence Pier.

READING.—The E.C. has approved a scheme for the rebuilding of Kendrick Girls' Secondary School at a cost of £20,500.

REDCAR.—The T.C. have received approval from the M.H. to purchase 20 acres of land for housing purposes, at a cost of £6,750. It was decided to ask permission to proceed with the erection of 100 houses.

ROSSINGTON.—The Main Colliery Co., Ltd., has notified the Doncaster R.D.C. of their intention to erect a large number of houses on the east side of the village of Wadworth.

ROTHWELL.—Plans passed by U.D.C.: House, for Mr. W. Brown; house, for Mr. Bedford; two houses, for Mr. Wilson; house, for Mr. B. Ward; house, shop and lock-up shop, for Mr. Hopton; housing site, Leadwell-lane, for Messrs. J. & J. Charlesworth & Co., Ltd.

RYE.—The T.C. has decided to approach the M.H. in regard to the rebuilding and widening of Tillingham Bridge.

SALFORD.—Plans passed by T.C.: Conversion of dwelling-house into shop and dwelling-house, 26, Great Clowes-street, Broughton; construction of lecture room, nurses' home, Hope Hospital, Eccles Old-road, Pendleton.

ST. HELEN'S.—The justices have agreed to the rebuilding of the "Nag's Head," Eccleston-street, for Greenall, Whitley & Co.

SHOREHAM.—An expenditure of over £4,000 has been sanctioned by Shoreham and Lancing Sea Defence Commissioners for groyning the eastern end of the foreshore.

SOUTHAMPTON.—Another church building scheme, which is meeting with support, is for the building of a permanent church of St. Agnes, with a seating capacity of 1,000, at an estimated cost of £20,000. It is still hoped by the Council that the M.H. will sanction the purchase of Byams Estate, Marchwood, for an isolation hospital site, at an estimated cost of £11,500.

SOUTHEND-ON-SEA.—Plans passed by T.C.: Five houses, The Grove, L. J. Simpson; bungalow, Theobalds-road, Twitchett & Co.; two bungalows, Oliviadrive, W. A. Gardner; house, Honiton-road, W. Ashley; bungalow, Ely-road, W. T. Cusdin; two houses, South-avenue, M. H. Fance; two houses, Marine-avenue, Leigh, Allen & England; bungalow, Burlescombe-close, F. W. Goldsworthy; four houses, Leighton-avenue, H. H. Puzey; two houses, Prittlewell-chase, Mrs. F. S. Best; three houses, Tankerville-drive, T. E. Gill; conversion of house into shop, London-road, A. A. Cardwell; lock-up garages, Leigh-road, Herritage, Bishop & Herritage; house, Chalkwell-avenue, G. A. Spencer.

SOUTHPORT.—Consent has been obtained from the M.H. for the granting of subsidies to enable the Corporation to make arrangements for the erection by private persons of 200 additional houses in the borough, and application has been made for sanction to borrow £10,000 for the purpose. Fifty of the houses will be built at Sandon-road, Birkdale. Plans and estimates are to be prepared for the erection of fifty small houses.——Application is to be made for sanction for a loan of £75,000, for the erection of an isolation hospital.

SOUTHWELL.—The R.D.C. has made application to the M.H. for sanction to borrow £7,500 for the purposes of a housing scheme of their own.

SPENBOROUGH.—Plans passed by U.D.C.: Bungalow, Westfield-lane, Scholes, for Mr. J. C. Phelon; 13 houses in the district.

STOKESLEY.—The R.D.C. have approved plans for the following: Bungalow at Great Ayton, for Mr. T. W. Burton; bungalow at Marton Moor-road, Nunthorpe, for Messrs. Potter & Humble; house at Stokesley, for Mr. Sweeting; house at Faceby-lane, for Mr. Hickson.

STRETFORD.—Plans passed by U.D.C.: Four houses and shops, Talbot-road, for Messrs. G. H. Brown & Son; 4 houses, Gorse-lane, for Messrs. G. H. Brown & Son; three houses, Burleigh-street, for Mr. Fred Thorpe; 111 houses, Marlborough-road, &c., for Mr. J. W. Maunders; house, Urmston-lane, for Mr. William Hy. Ellis; extension of works, Smith-street, for Messrs. Samuel Whittaker, Ltd.

SUNDERLAND.—The E.C. propose to extend the laboratory accommodation at the Technical College in order to enable them to secure affiliation to the University of Durham, and an expenditure of £7,500 is estimated for additional buildings and alterations.

TODMORDEN.—The M.H. has sanctioned a proposal of the T.C. to subsidise an additional twenty houses, and has agreed to a further loan of £2,000. Plans are also being prepared for non-parlour houses on the Ferney Lee site, the building to be carried out by contract.

TYNEMOUTH.—The Housing Committee have reported to the T.C. that the housing architect has been instructed to prepare a block and sketch plans for the erection of an additional 50 maisonnettes at Balkwell.

UPPINGHAM.—The U.D.C. has approved a scheme for the building of 72 houses. These are to be divided amongst the parishes as follows: Uppingham 20, Barrowden 6, Belton 2, Bisbrook and Glaston 4, North Luffenham 6, South Luffenham 6, Lyddington 4, Morcott 3, Preston 4, Ridlington 2, Seaton 6, Wing 6.

WALVERLEY.—The R.D.C. and the local E.A. are urging the B. of E. for the immediate provision of a new Elementary School at Walverley.

WARSOP.—In view of housing developments near the Welbeck Colliery, remaining sections of Netherfield-lane School are to be completed, giving additional accommodation for 408 children and a central hall, estimated cost £9,900.

WASHINGTON.—The R.D.C. have decided to make application for permission to erect another 76 houses on the Spout-lane site.

WEMBLEY.—The Wesleyan Methodist Church Council propose to erect a new church, with seating accommodation for 600 people, at an estimated cost of £12,500.

WEETSLADE.—The R.D.C. have approved plans submitted by their surveyor for the erection of an additional 16 houses on their housing estate at Annitsford.

WHITBY.—Plans passed by R.D.C.: Shop at Sleights, for Mr. H. Lawson (plans by Mr. A. E. Young); four semi-detached houses in Station-road, Robin Hood's Bay, for Messrs. Robinson, Randall & Emmerson (plans by Mr. J. Rickinson); bungalow on Egton-road, Aislaby, for Mr. John H. Watgate.

WHITLEY BAY AND MONKSEATON.—Plans for a further 58 houses have been approved by the U.D.C.

WIGTON.—The M.H. has held an inquiry regarding an application by the U.D.C. for an additional loan of £5,000 for sewerage and sewage disposal works.

WILLESDEN.—Plans passed by U.D.C.: St. Luke's Memorial Hall, Canterbury-road, Kilburn, by Mr. R. P. Kennedy, for the vicar of St. Luke's Church, Kilburn; house, 100, Dewsbury-road, Willesden, for Messrs. Pearce & Taylor; three houses, 80, 82 and 84, Brondesbury Park, by Mr. F. Stanley Allen, for Messrs. Western by Mr. P. J. Symonds, for Mr. J. C. Webb; 10 houses, Oxgate-gardens and Dollis Hill-lane, for Mr. F. W. Brealy; boiler-house, &c., Neasden-lane, Neasden, by Mr. H. Shaw, for the Neasden Waxed Paper Co.; workshop, Mordaunt-road, Harlesden, for Messrs. M. Greenwood & Son, Ltd.; four houses, Fleetwood-road, Dudden-hill, Willesden, by Mr. P. J. Symmons, for Mr. J. C. Webb.

WORCESTER.—The C.C. propose to reconstruct the Bilford-lane Canal Bridge at an estimated cost of £4,100, Bilford-lane Bridge over Barbourne Beck at an estimated cost of £2,050, and Lansdowne-road Canal Bridge at an estimated cost of £2,400, subject to the sanction of the M.H.

YORK.—Plans passed by T.C.: A. Jessop, house, Moorgate; C. Martin, two houses, Lime-avenue.

FIRES.

BANFFSHIRE.—The Public School of Sandend, near Portsoy, Banffshire, has been completely destroyed by fire.

BUCKIE.—A fire has occurred at the fish-curing premises of Mr. W. Hill, Low-street.

ROEHAMPTON.—A fire has occurred at Queen Mary's Convalescent Auxiliary Hospital for Limbless Men at Roehampton House, and a large range of buildings was destroyed.

ST. PANCRAS.—Great damage was done by a fire which has occurred at the works of the General Motor and Tyre Co., Caledonian-road.

Epstein Busts for Aberdeen.

The Art Gallery Committee of the Town Council, at a recent meeting, decided to purchase two bronze busts by Epstein—one of Mr. R. B. Cunninghame Graham, and the other entitled "Old Pinager."

These works of art were first shown in London and in the Leicester Galleries, where they are now on exhibition. They have been acquired at a price of £150 each.

THE SCOTTISH BUILDER

NEW BUILDINGS IN SCOTLAND.

Edinburgh.—HOUSES.—The Dean of Guild Court has passed the following plans: Mr. A. H. Duncan, bungalow, Dumbrae-road, Corstorphine; Mr. A. E. Hasefield, villa, Barnton-avenue, Davidson's Mains; Mr. S. McKenzie, house, Haughton-road, Corstorphine; Mr. Alexander Raitt, bungalow, Dovecot-road, Corstorphine; Mr. J. Ross, bungalow, Dumbrae-road, Corstorphine.——The Housing Committee has agreed to recommend the T.C. to proceed with the erection of 1,000 houses at Lochend.

Kirkintilloch. — SCHOOL. — Dumbartonshire Education Authority has decided to erect a new secondary school in connection with St. Ninian's Roman Catholic School, at Kirkintilloch.

Broughty Ferry.—PAVILION.—The T.C. has asked the City Engineer to submit a report regarding the erection of a proposed pavilion.

Greenock.—BUILDING.—The Committee on Secondary Education has recommended the provision of a new building for Greenock High School.

Renfrew.—HOUSES.—The Board of Health has approved of the site decided on by the T.C. for the erection of 60 houses in Sandy-road.

Broughty Ferry.—TENEMENTS.—Erection of tenements for T.C. of Dundee. Applications to be addressed to Mr. J. Thomson, Director of Housing, City Chambers, Dundee.

Buckie.—HOUSES.—Painter work of seven blocks of houses in course of erection. Schedules from Mr. W. Hendry, Burgh Surveyor, or from Messrs. G. Sutherland and C. George, Architects, 26, Crown-street, Aberdeen.

Aberdeen.—CLUBHOUSE EXTENSION.—Extension of Deeside Golf Club house at Bieldside. Brown & Watt, Architects, 17, Union-terrace, Aberdeen.

MARCH 11.—**Kirkcaldy.**—EXTENSIONS.—Extension to Education Offices, Wemyssfield, Kirkcaldy, for Fife Education Authority. Particulars from Mr. G. Sandilands, Education Offices, Kirkcaldy. £1 1s.

CASTLE OF COULL UNEARTHED.

MR. W. DOUGLAS SIMPSON, M.A., F.S.A., lectured recently at Aberdeen on "The Rediscovery of Coull Castle." In the course of his remarks he said the important Castle of Coull, situated in the beautiful Howe of Cromar, between Aboyne and Tarland, was the chief seat of the great family of De Lundin, better known as the Durwards, hereditary Door-wards at the Scottish Court.

The Durwards erected three castles. Two, the Peel of Lumphanan and the Castle of Strachan, were moated and palisaded mounds of the earlier Norman type. The third, at Coull, forming the capital messuage and administrative centre of the barony, was a great building of stone and lime of the fashion just then coming into use in Scotland. During the War of Independence the castle was held for England, first by Sir John de Hastings and then by the Earl of Atholl.

After its desertion the ruined castle had become entirely buried, though at the end of the eighteenth century the remains were partly exposed during diggings made for lime. An account written on that occasion made it clear that the castle must have been an exceptionally large and powerful specimen of its class, and stimulated Dr. Marshall Mackenzie, when he acquired the property in 1912, to commence excavations on the site with a view to exposing the ruins once again. Interrupted by the war, the excavations had been resumed, at Dr. Mackenzie's request, by Mr. Simpson during last summer. The general result had been to recover one of the oldest and greatest of Scottish castles from burial and oblivion.

As exposed to-day, the buildings consisted of a courtyard 110 ft. in breadth, enclosed by walls varying from 7 to 18 ft. in thickness. Remains of three flanking towers had been revealed, one of which, forming the donjon or keep, was 32 ft. in diameter, and still existed to a height of 14 ft.

An interesting feature of this tower was that it had been greatly damaged at an early date, evidently by an attempt to undermine it, and had afterwards been clumsily repaired. In front of the main gate was a long, deep pit, hewn in the solid rock, which had been spanned by a drawbridge.

Bruce's well-known policy was to dismantle castles as soon as he recovered them, and Coull Castle was known to have been held by the English as late as July, 1305. At the end of 1307 Bruce invaded Aberdeenshire and won the battle of Inverurie. It was known that all the castles held for England were recovered in the following year. And although Coull Castle was not specifically mentioned, it was reasonable to assume that it had been captured and destroyed in that year.

Forthcoming Books.

In their list of books for the spring season Messrs. B. T. Batsford, Ltd., include the following:—"English Decoration and Furniture of the Early Renaissance," by Margaret Jourdain, being the first, yet final volume of the "Library of Decorative Art"; "The Story of Architecture," a popular outline, by P. Leslie Waterhouse, M.A.; "The Decorative Arts in England during the late Seventeenth and Eighteenth Century," by H. H. Mulliner; "Sketching in Lead Pencil," for students and architects, by Jasper Salwey, A.R.I.B.A.; "Building Construction Plates," for students, two parts, elementary and advanced, by A. Buchanan and W. H. Hudson; "A History of Ornament (concluding part) in Renaissance and Modern Times," by Professor A. D. F. Hamlin; "Colonial Furniture of the Pilgrim Century" (1620–1720), by Wallace Nutting; "Industrial Arts for Elementary Schools," by Bonsor and Mossman, with 280 illustrations; "Poster Design: A Study of its Recent Development in Europe and America," by Charles Matlack Price.

BUILDING TRADE WAGES IN SCOTLAND.*

THE following are the present rates of wages in the building trade in the principal towns of Scotland. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur:—

* These prices apply to *new buildings only*. They cover superintendence by foreman and carry a profit of 10% on the prime cost without establishment charges. A percentage of 1¼ should be added for Employers' Liability and National Health and Unemployment Acts and from 1s. 6d. per £100 for Fire Insurance. The whole of the information given on this page is copyright.

HOUSING SCHEMES.

THE Ministry of Health recently issued the following statement :—

A conference was held at the Ministry of Health on the 19th ult., with representatives of the suppliers and producers of building materials. Mr. Wheatley, the Minister of Health, who presided, was accompanied by Mr. Shaw, the Minister of Labour; Mr. W. Adamson, the Secretary for Scotland; Mr. Greenwood, the Parliamentary Secretary of the Ministry of Health; and Mr. James Stewart, Under-Secretary for Scotland.

Mr. Wheatley explained that before launching its housing scheme the Government were anxious to obtain the co-operation of all sections of the building industry, so that they might be assured not only that the necessary labour, materials, and other facilities would be available to ensure that houses would be produced in sufficient numbers, but also that the houses would be provided at a fair and reasonable price. The Government wished each part of the industry to approach the question from the same point of view, namely, that no section should make an effort to secure improved conditions as a result of the launching of the housing scheme which it would not have been able to secure apart from that scheme. Mr. Wheatley hoped that it would be possible to devise means to carry out a programme of building through the ordinary organisation of the industry, and that this could be done in such a way as to make control unnecessary.

On behalf of manufacturers of materials the following representatives of important sections of the industry spoke :—

Mr. W. H. Wright, President of the National Building Brick Federation; Mr. Richard Jewson, Timber Trade Federation; Mr. Barlow, Northern Federation of the Building Brick Industry; Mr. John King, National Light Castings' Association; Mr. G. H. Richards, North Wales Slate Quarries; Mr. H. J. C. Johnston, Employers' National Council for the Clay Industry; Mr. P. M. Stewart, Cement Makers' Federation, Greystone Lime Burners' Association, Pressed Brick Makers' Association; Mr. F. G. Foster, Member, Mid-Yorkshire Lime Makers' Association, President, Sheffield and District Lime Makers' Association; Col. Foster, United Kingdom Lead Manufacturers' Association.

The speakers assured the Minister that the Government would have the whole-hearted co-operation of the materials' manufacturers of the country, and that there would be no attempt to advance prices as a result of the housing scheme.

A small committee was appointed by the representatives present to co-operate with the committee of the employers' and workers' organisation, which has already been set up with the object of submitting proposals to the Government.

BRISTOL BUILDERS' DINNER.

THE annual dinner of the Bristol Association of Building Trades' Employers was held recently. Mr. C. R. Setter presided, and amongst those present were the Lord Mayor, the Sheriffs, the Bishop of Bristol, the President of the Bristol Chamber of Commerce, the ex-President of the National Federation of Building Trades' Employers (Mr. W. H. Nicholls), the President of the Western Federation (Mr. E. P. Bovey), the President of the Bristol Society of Architects (Mr. W. S. Skinner), and the hon. secretary (Mr. W. J. Stenner), the Town Clerk, City Engineer, Docks Engineer, City Valuer, the President, Bristol Plumbers' Association (Mr. H. J. White), the President, Bath Builders' Association (Mr. G. Hayward), and the President, Clerks of Works' Association (Mr. C. H. Trevelyan).

Mr. C. F. W. Dening proposed "The National Federation of Building Trades' Employers," and said the Federation was on better terms to-day with architects and the allied professions than it had ever been. The spirit that pervaded the building trade to-day was anxiety for good work. Before they could tackle the rebuilding of Bristol it was necessary to have a comprehensive plan and a general lay-out for the development of the city.

Mr. W. H. Nicholls, responding, said the National Federation was looking to Bristol to play an increasing part in the Councils of the National Federation in the near future. Bristol had not done badly, but there was a great deal more it could do to help to grapple with the serious problems to be dealt with in the near future. So long as they had good homes they would have a contented people. But these things must be accompanied by economic business methods. In attempting to solve this question they had to be extremely careful that they did not ruin for ever the trade that for many years had provided the homes for the people.

In submitting "The Bristol Association of Building Trades' Employers," the Sheriff said the men in the trade had always done their part. There were great difficulties in the housing question, and some way must be found to surmount them.

In response, the President said they all felt their responsibility with regard to housing, but they wanted the public to feel that they had a responsibility towards the builders to make it possible for them to solve the problem. He believed they had arrived at a point when there could be co-operation.

In responding to "The Visitors," proposed by Mr. F. N. Cowlin, Mr. W. S. Skinner said that in Bristol they had one of the few architectural schools in the country, and it was doing very good work. Regarding housing, this would settle itself in a very short time if the trade unions would relax their rules and allow them to work as long as they would at piece-work.

Mr. L. S. McKensie (City Engineer), who also responded, said he was disappointed at the housing progress. It was the most serious and difficult problem before the country. Only 1,500 houses had been erected in Bristol since the war, and the slums had not been touched. More co-operation was needed to get the work done.

THE LONDON MASTER ASPHALTERS' ASSOCIATION.

ON February 29, the fourth annual dinner of the London Master Asphalters' Association was held at the Restaurant Frascati. Mr. G. Mitchell presided.

After the loyal toasts had been honoured, Mr. Francis J. Sim, in proposing the "London Master Asphalters' Society," said, although this was only their fourth annual dinner, it had been a very successful Association, and was recognised as being of the greatest value to all concerned. They were, in regard to the question of prices, concerned with keeping them at a suitable economic level, without undue fluctuations.

Mr. G. Mitchell, responding, said the success of the Association was due to the efforts of the preceding chairmen and officials concerned. He hoped the past dignity and character of the Association would be maintained, and that they would continue to work in harmony with allied associations.

After Mr. J. B. London had proposed "The Chairman," Mr. G. Mitchell, responding, said it was due to Mr. Cooper that the Asphalters' Association, which had one of the best names in the world, ever came into being. He hoped that in the future, as in the past, they would get along with the minimum of friction.

The "Immediate Past Chairman" was proposed by Mr. T. D. Cooper, who reiterated the necessity for binding themselves together even more closely, if possible, than in the past. Only on this basis could they maintain their past success.

After the "Immediate Past Chairman" had replied, Mr. S. D. Clements proposed "The Visitors," to which Mr. Alexander Ritchie replied.

TENDERS.

Communications for insertion under this heading should be addressed to "The Editor," and must reach him not later than Tuesday evening.

* Denotes *accepted*. † Denotes *provisionally accepted*.
‡ Denotes *recommended for acceptance*.

THE BUILDER

A JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR.

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

VOL. CXXVI.—No. 4232. MARCH 14, 1924.

THE ASSESSMENT OF COMPETITIONS

ONE of the chief among our purely architectural difficulties is that of the assessment of competitions. The present practice is provocative of so much recrimination and discontent that the whole system will have to be brought under review if the architectural competition is to hold what prestige it still retains. It must be understood that we cast no personal reflections when we say that the decision of the assessor or assessors must be final and conclusive and accepted as such by every competitor. The batsman does not dispute the umpire's decision, and the same rule must hold good in the more serious affairs of life. It is, of course, always possible that matters may come to such a pass that protest becomes desirable for the public good, and the fact that some competitors have recently come to the conclusion that this point has been reached shows that there is a strong feeling, at least in certain quarters, against the present regime. At the same time, if any changes are made those that make them should bear in mind the importance of binding every competitor to accept the award, on the ground that if he does not approve of the methods employed he should refrain from entering as a candidate.

Turning to the qualifications necessary in an assessor, obviously the main essential should be that he is acquainted at first hand with the problem to be solved. For example, it is clearly idle for an architect, however brilliant he may be as a designer, to judge a scheme for a concert hall if he is ignorant of acoustics, and so fails to take this vital requirement into account, or to judge a school or hospital if he knows little of school or hospital methods. These considerations would seem very obvious, but it is so often the obvious that is overlooked. The increasing specialisation of the day cannot fail to render older and more general methods obsolete. But while we avoid this Scylla, we must be careful lest we fall into the Charybdis of pure "practicality," and it would be fatal to good architecture if designs were selected solely for their practical efficiency. It is the extreme difficulty, one might almost say the impossibility, of getting one man who is sufficiently acquainted with the practical requirements in any given type of building and who is also a real judge of architecture that provides one of the strongest arguments in favour of the jury system.

We have always kept an open mind on the respective merits of the single assessor or the jury of assessors, but on one point there can hardly be two opinions. When competitors know who is to assess the designs, there invariably ensues a rush to find out his foibles, his peculiarities, and his weaknesses; frequently, anything he may have written is eagerly devoured, and the object of the competition—to produce the best building—is obscured behind a host of irrelevances concerning the whims of one particular man. This is the weakest point in the single assessor system, and it might to some extent be overcome by naming, say, three or four assessors, and stating that the judging would be undertaken by one of their number. This might eliminate the most serious objection to one man, but, as we have seen, it can still be argued that no one man can have the knowledge and the breadth of vision to select the design that is best as a whole. The one-man system, on the other hand, possesses certain advantages. He knows what he wants, and can select and weed out far more quickly than can a jury; he is easier to get hold of and cheaper to pay. The difficulty lies in finding the right man and in preventing candidates from knowing who that right man is.

Undoubtedly, the gravest objection to competitions generally is the great waste of labour involved in a multitude of competitors submitting what are really working drawings, and the practice of requiring only the simplest pencil drawings in the first instance, and reserving careful details for a final panel of selected candidates, should be extended. Unnecessary labour on the part of candidates should be ruthlessly eliminated, and any alterations in the conditions avoided after competitors have begun work. The conditions should be explicit and final. The showers of questions that we so often see answered in what is virtually a supplementary list of requirements are sure evidence of a slovenly schedule of conditions in the first instance.

Whatever may be said of the system of allotting marks for the different aspects of the design—plan, elevation, &c.—it is hard to justify the giving of marks for the draughtsmanship and rendering generally. If a design is calculated to produce the finest and most suitable building it would seem absurd deliberately to build a slightly inferior building solely because it was better drawn on the original plan. It can only be through the drawing that an assessor can tell that certain plans and elevations, &c., are the best designs submitted, and surely if the drawing can prove that it is all that ought to be required of it. It could be of no satisfaction to a future generation to be told that its museum would have been a better building but for the excellent quality of the drawings that produced the inferior reality!

One of the stumbling blocks in the way of instituting a system of juries is that of remuneration, but given that system we would suggest that just as the citizen has to sit on ordinary juries with either no remuneration at all or at best with only a trivial sum, it should be agreeable to the architect, with the privilege of an assured reputation and a responsibility towards architecture, to sit on a competition jury at a low rate of payment; that is to say, low enough to make the jury practicable to those promoters of competitions who wish to employ it. This suggestion is not new, but it merits the serious consideration of the profession. It is astonishing how much time architects are prepared to spend gratis in attending meetings of importance to the profession without prospect of return, and since architecture itself takes precedence over the profession that practices it, it should not be hard to surmount the difficulty of paying a jury where the jury system is adopted. Whether or not it is considered desirable to substitute the jury system for that at present in operation, we believe that the whole question of competitions should be reviewed not only in order to attract the best work, but also to retain public confidence, without which the whole competition system must be worse than useless.

Since the above was written we have received, and give on p. 421 a draft revision of the R.I.B.A. Regulations for Architectural Competitions.

NOTES.

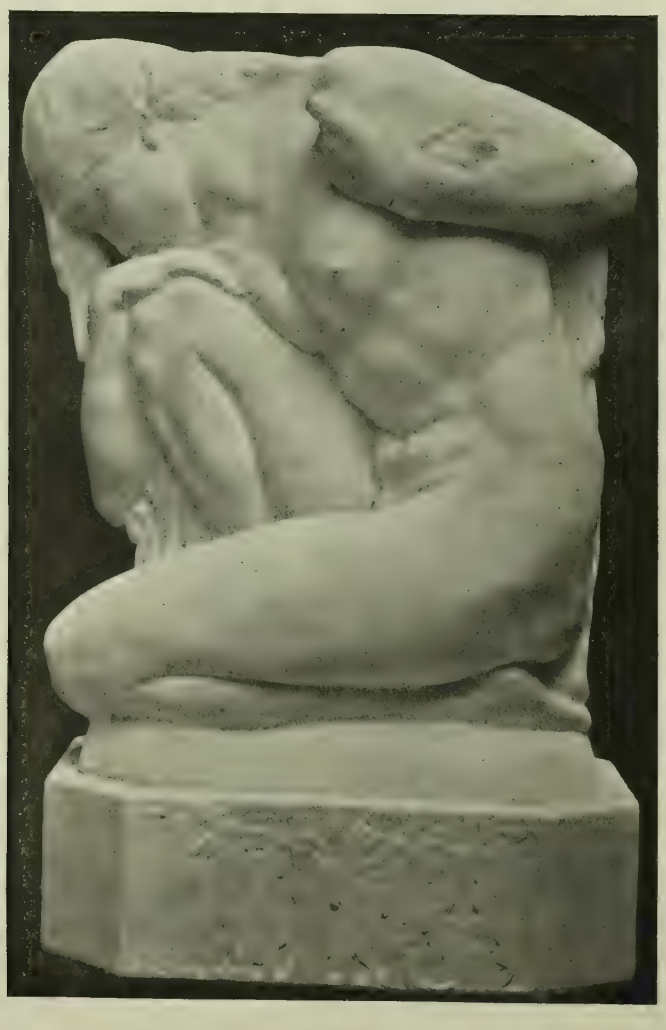
Lord Curzon's Address.

The opening by Lord Curzon of the Architecture Club Exhibition at Grosvenor House on Tuesday was a successful event upon which the Club may well be satisfied. Before an audience which included many well-known architects, Lord Curzon delivered an address of much charm and sagacity, which showed a knowledge of architecture not usually possessed by an "amateur," as he styled himself, even when "deeply interested" in architectural work. There was much in the address which could not fail to be stimulating to architects, especially his concluding remarks on what to avoid, and his belief that although there is, perhaps, some decline in the knowledge of and interest in architecture shown by those now representing the old-time patrons of the arts, there is appreciation shown by a far larger public, due in part to the architectural Press. This is, we hope and believe, a well-founded conclusion which will give encouragement to the Royal Institute of British Architects and other bodies, as well as the Club. We can all agree with Lord Curzon's references to the beautiful old cottages to be found all over the country; but the suggestion he made, in contrasting these old buildings with modern cottages and villas, that perhaps the modern cottages are not the work of architects, hardly does justice to the architects of many delightful cottages built in recent years; though in saying this we are not forgetting the others, and these, no doubt, Lord Curzon had in mind.

At the A.A.

Mr. Goodhart-Rendel's talk on "the Gothic Survival," at the A.A. on Monday night, provoked a stimulating discussion, although the lecturer's extraordinary memory and amazing research tended, perhaps, to scare his adversaries from giving him battle on his own ground and restricted them to generalities. It was generally agreed that it is indefensible to design a building that by the nature of its requirements is hopelessly assymmetrical and to force it into a symmetrical classical form, and the lecturer maintained that it has been the survival of the Gothic spirit in England that has helped to keep us free from the cramping classical symmetry that has been adopted by so many other countries. It was rather taken for granted that we are reverting to the classical, but are we not really trying to frame an expression that is neither one thing nor the other—an expression that selects from every style that which meets our present needs, but that throws the rest overboard? Mr. Goodhart-Rendel wisely reminds us that although we may not admire nor wish to imitate the work of the Gothic revival, yet there is a great deal that we can learn from that movement in the direction of freedom and plasticity; but, above all, let us remain English and retain our characteristic insular prejudices!

St. Paul's Bridge.



Little encouragement could be felt from the reception of the deputation from the London Society, the R.I.B.A., the Town Planning Institute, and the Architecture Club to the Minister of Transport, Mr. Harry Gosling, M.P., on Tuesday. The Minister said it was asking a big thing to go back on the Government's previously promised support; but Mr. Rees Jeffery's objection to the City being turned into a traffic corridor remains unanswered. Who or what there is to save London from this unfortunate enterprise it is difficult to see.

Competition Conditions.

One important item in the revised list of regulations for Architectural Competitions, just issued by the Institute, is the insistence on the appointment of an assessor, or assessors, of architects of acknowledged standing, who shall review the whole of the designs, and whose award shall lead to the appointment of the first-placed competitor as architect. But, obviously, a coach and four may be driven through all precautions, and an ecclesiastical architect of "acknowledged standing" might be called upon to settle the design of a hospital or an intricate commercial undertaking. And the descriptive title "of acknowledged standing" might imply that the "standing" and the "acknowledgment" involved artistic capacity. Our experience tells us that the acknowledgment of artistic power is a fragile bridge to fame.

Building from Structure.

The lectures which Professor Richardson has delivered at three of the most important educational centres in the country are a valuable contribution to the study of present-day architectural development in the light of a definite structural principle instead of the haphazard methods which so largely obtain. Structural principles must surely figure largely in our architectural outlook, and should never be ignored; but it would be a mistake to pretend that these alone are a sufficient guide. If we have no instinct for beauty and distinction within ourselves we shall only be working with dry bones, and it is from those who have the artistic, whether instinctive or acquired, that we can hope to receive that

"The Unfolding of Spring." (In Marble, Life Size.)

vivifying influence that shall make the dry bones to live.

Clopton Bridge. The plea recently put forward by the S.P.A.B. for the preservation of the ancient bridges of England is one worthy of the most sympathetic attention, but the particular instance of Clopton Bridge derives importance not only from its architectural character, but its association with Shakespeare's birthplace. Unfortunately, it lies in the way of much traffic, being a link on the main road from Birmingham to London, and is no longer adequate for present-day traffic. All this may be granted without admitting any claim arising out of it justifying any alteration of the bridge, especially as a new bridge can be constructed a little higher up the river to meet the requirements of traffic. It has the advantage also that the old bridge could then be restored to its original condition, and the cast-iron bracketed structure removed, which disfigures it so much at the present time. We are glad to learn that an interview has been arranged with the Minister of Transport and the S.P.A.B. in which the Society is putting forward the claims of these old bridges for preservation. Clopton Bridge was built a century before the birth of Shakespeare, and is a fine example of fifteenth-century bridge building.

Influence of Materials. An interesting paper read by Mr. C. E. N. Brome-head before the Royal Geographical Society on "Natural Resources in Relation to the Arts," dwelt on the influence of local materials on building and their importance to architecture, as directing its style; varying in different localities according to the rocks and minerals available. In his reference to concrete the lecturer perhaps did less than justice to its claim to evolve a treatment that was native to itself in saying that most of the work done in concrete was in imitation of stone. We think that concrete building has already established definite characteristics of its own, and that in this way it can give a good account of itself, and it is because of the architectural features developed through its use that it has attracted so much attention at the present time, no less than for its general adaptability as a building material.

The Superstition of Materials. It was peculiarly characteristic of Victorian times to place the emphasis on the wrong thing, or rather, perhaps, to place our values on material things. We should be sorry to deprecate a good standard of materials for working in, but we may erect this into a superstition, if we have only eyes for English oak and Portland stone, and vest the merit not on the excellence of its use but on the material itself. So when we consider the decorative treatment of the new premises in Cavendish-square, which we illustrate this week, we are glad to notice that the figures in relief executed by Mr. Gilbert Bayes are fashioned in cement. The artist knows how to make materials yield to his will, and discovers the possibilities lying in them. Cement is a material of the kind and its use for sculpture and outside work is full of possibilities. In resorting to materials of less cost in initial outlay, an impetus will be given towards the decoration of our streets, and we are glad to see an example of this new decoration on these premises.

The late W. H. Ward. By the death of Mr. W. H. Ward the profession loses one of its most gifted representatives whose work will live after him—not, as with other architects, in bricks and stones, but in at least an equally permanent form as an architectural historian. His great work on the "Architecture of the French Renaissance," put him in the front rank of architectural writers and gave him a deservedly high reputation as an original thinker with a gift of lucid expression. Like many other exceptional men he had a retiring disposition and was not, perhaps for that reason, as well known to the public as he should have been, but his intimate friends and all who knew him will deeply regret the loss of a gifted and lovable man.

Della Robbia-ware Decorative Panel from "Children's House," Bow.

GENERAL NEWS.

Professional Announcements.

Mr. Wilfrid L. Evershed has resigned his position with H.M. Office of Works and taken offices at 51, High-street, Guildford. He will be pleased to receive copies of catalogues and prices.

The name of the architectural and surveying firm of Messrs. Ralph Booty and Co., is changed to Messrs. Booty and Edwards. Singapore address, Winchester House, Singapore; Colombo address, Architect's Office, New Town Hall Site, Colombo; London agents, Messrs. Theobald & Gardiner, 96, Gower-street, London.

Ferro-Concrete Lions.

The six lions which will flank the broad flight of steps leading up to the portico of the Government Pavilion at Wembley are made of concrete. They have been designed on a massive scale and will be 20 ft. long and 8 ft. high, and are conventional adaptations of the lions in Trafalgar-square. They were first modelled on a small scale. The first model was 1-24th full size, the second 1-4th full size. The full-size lion is cast in no more than twenty-five moulds, each interlocking with the other. The casting takes three days, and the setting three days.

New Lake at Eastbourne.

The Eastbourne Council has received sanction for the construction of a model yachting lake, at a cost of £10,000, at the Crumbles, Eastbourne. The Council also propose to erect 178 houses, while a municipal golf links is contemplated.

R.W.A. Architectural Exhibition.

Eight of the sets of drawings which were submitted for the final round of the Victory Scholarship Competition (£100 and a gold medal awarded by the Society of Architects) were recently exhibited at the studios of the Royal West of England Academy School of Architecture, Bristol. Two students from the R.W.A. School, Messrs. A. J. Saise and R. H. Brentnall, were chosen from forty competitors, representing the architectural schools of the kingdom, in the preliminary competition. Mr. Eustace H. Button, who recently passed his final R.I.B.A. examination at the head of the year's list for the British Empire, and won the Ashpitel Prize with distinction in thesis, is now on the staff of the school.

New Bridge Over the Tyne.

The Newcastle City Council recently resolved to promote a Bill in Parliament, in conjunction with Gateshead, for the construction of a new bridge over the Tyne connecting the two towns.

Board of Architectural Education.

An exhibition of successful designs submitted in answer to the bi-monthly problems in design will be held at the R.I.B.A., 9, Conduit-street, W.1, from March 15 to March 22 inclusive, between the hours of 10 a.m. and 6 p.m. (Saturdays 10 a.m. to 1 p.m.).

Obituary.

Mr. Edward James Shrewsbury, A.R.I.B.A., who died recently in Maidenhead Hospital, was one of the founders of the Berkshire Archæological Society.

COMPETITION NEWS

Masonic Peace Memorial.

For full particulars of this competition see our issue for February 8. No sending-in date has yet been fixed.

Barton-on-Irwell.

The sending-in day for this competition is June 28.

Newcastle Fire and Police Station.

Newcastle City Council has decided to hold a public competition amongst architects for plans for the proposed new police and fire brigade station on the Marlborough-crescent Market site. Buildings are to cover 2,465 yds leaving the remainder for an open court yard. Three premiums, amounting in all to £900 will be offered for designs, and an assessor nominated by the President of the Royal Institute of British Architects and approved by the authority, will be appointed to adjudicate. Sending-in day, March 27. In a recent issue it was stated that the cost of this work was estimated at £12,500; we now understand that the cost is likely to be about £125,000.

Other Competitions.

Other competitions still open include the following (the dates given are, first the sending-in date, and second the issue of *The Builder* in which full particulars were given):—Essay on Heating and Ventilating (Mar. 31 Nov. 9, 1923). Industrial Designs (June Dec. 21, 1923). National Theatre (April 26 Monument to Sir Wilfrid Laurier (April Dec. 14, 1923). Belfast Union Lighting (March Nov. 9, 1923). Ross-Smith Memorial (Sept. 30 Feb. 1).

OUR CONTEMPORARY SCULPTORS

GILBERT BAYES

Few living sculptors have executed more attractive work than has Mr. Gilbert Bayes. He has made excursions into many of the fields of plastic art, and all of them have achieved success. Some of his theories, principles and qualities seem to stand out prominently when his work is reviewed, and are of more than ordinary interest. He considers that all art should be "likeable." This is by no means synonymous with the late Victorian ideal of "prettiness"—indeed, nothing could be farther from his thoughts. He feels that all sculpture must have human interest, beauty of form, and attraction, so that it creates a feeling of pleasure or satisfaction. No one can deny the success which these theories have achieved.

The value of Mr. Bayes' work is enhanced when it is placed in an architectural setting because he has a wonderful facility for catching the spirit of his surroundings and for modelling work which achieves complete harmony. It therefore comes about that he can work with architects with widely differing aims; he can catch the spirit of buildings with different intentions, and will add to their beauty and interest in every case. The harmonious working of architect and sculptor is one of the foundations of successful joint work, and it is impossible to lay too much stress upon this valuable quality.

A third quality is visible principally in his equestrian work. Here he has attempted with unqualified success to portray action. Action as a constantly changing condition creates difficulties in portrayal which are only realised when encountered. No individual photograph from a slow motion picture will adequately represent the complete series, yet this is the task which the sculptor encounters when he models a group portraying movement. Gilbert Bayes has studied his subject so well and so accurately that he is able to exaggerate actual form and to create effects which are full of life, sculpturesque and wonderfully truthful.

Colour has played but a small part in the plastic art of England, and few men have seriously delved into its possibilities. Mr. Bayes has added enamel to his bronzes and given them vastly increased interest, and he is even now finding excellent material in the study of coloured wood and glazed terra-cotta.

"Sigurd" in the Tate Gallery, London, has previously been illustrated in *The Builder*. It shows the artist in his most brilliant mood, with a highly decorative bronze enriched with small spots of enamel giving a group full of action and interest. It is a work that will live, and will always find many enthusiastic admirers. The promise of greatness in equestrian work makes the lover of sculpture regret that the great bronze groups of "War" and "Peace" now in course of erection outside the Sydney Art Gallery are so far away. There should be a Gilbert Bayes' equestrian in London. Both the Sydney groups are finely modelled and very decorative. The horses in particular have an individuality which is very rare. Vigorous sculpturesque heads, sturdy muscular limbs, give them an artistic quality that mere copyism could never produce. The rider in each case is part of his steed. Mounted bare-back, he conveys a primitive atmosphere which is most convincing and, viewed in conjunction with good architecture, both groups will be most effective.

Similar architectonic qualities are displayed in the groups, "The Bronze Age" and "The Stone Age," which crown Messrs. Smith & Brewer's fine building for the new museum at Cardiff. These groups seem to be conceived in the spirit of masonry. They grow out of the structure and become crowning points of interest instead of being, as sculpture groups so frequently are, mere adjuncts and accessories. There is composition in these groups of a high order, good treatment of flesh and drapery, broad simple heads and features. They achieve, in fact, the ideal in architectural sculpture.

In somewhat lighter vein is the work of the Law Society's War Memorial at their headquarters in Chancery-lane. This lighter treatment harmonises with the surroundings in which it is placed. The motto, "They died that we might live," forms the motive for a panel of charming children who, with unaffected ingenuousness, play pipes, blow upon horns, and within the limits of a conventional treatment convey the impression of freedom from care and perfect happiness. Thus is given a new aspect to the sacrifice of the flower of England's manhood and the ends which it died to gain. But children have a fascination for the sculptor, and he succeeds in obtaining a wonderfully attractive representation. In the Todmorden War Memorial there are two "wee men," which are primarily pieces of fine stone ornament. In detail they have wonderful attributes. In particular, one which holds a lamp delights the beholder with its beautiful outline and serious aspect. A recent sketch for a garden figure in colour reaches the high level of the Todmorden figure with the lamp. The coloured figure is just a fantasy—a boy with a fish. It is the handling of the masses, of the detail and the drapery that gives it real attraction.

A Garden Figure in Colour.

The frieze of the children's orchestra in the new Brinsmead building, which is reproduced on p. 414, shows another great example of Mr. Bayes' powers of child presentation. All the children are attractive, but the central figure of the little girl pianist is marvellously fascinating, while the contrast of the serious double-bass next to her gives to both a piquancy that is invaluable.

In the study of the nude, Mr. Bayes shows the hand of the master. Not only is he able to produce form of great beauty but he can impart to it unmistakable individuality. "The Unfolding of Spring" is a typical example. Its lines and masses suggest the tenderness of maiden youth, the subtle roundness of the perfect human figure. There is a fine sense of proportion and drawing which is admirable.

The sculptor thinks that much work that would be otherwise great is spoiled because the material is not considered soon enough, whereas it should be one of the first considerations. In this case he designed the group as a piece of carved marble, and personally worked on the carving to a very large extent—a fact which is responsible for the great success achieved.

Portrait work has not been particularly prominent, but a few essays in this direction show that the power is there. The relief of Professor Lethaby modelled a few years ago has a nobility of expression which is very true to the character of the sitter, while the freshness of the technique is most attractive.

Recently Mr. Bayes has made fresh excursions into the realm of coloured reliefs in Della Robbia ware and other media. One of the best of these is for an over-door at the Children's House, Bow, in which is portrayed a Virgin and Child in a lunette with supporting figures of children and seraphs. The relief is handled in a characteristic manner, vigorous, powerful, and attractive, while composition and subject-matter have received a due amount of attention. The colours principally employed are blue, grey, white and yellow, with other subdued colours in the swags. Less architectural, but essentially decorative, are some examples of panels in carved and coloured wood portraying everyday scenes. A girl in a hammock, an ox plough, a water cart, and a wagon have been some of the subjects of these essays. There is a wealth of detail in the animals, figures, trappings and accessories which makes them sumptuous pieces of ornament. These little works are playful and fantastic, but very attractive, and might form a valuable adjunct to an architectural screen or similar object in a building.

Many seals and medals have been modelled by Mr. Bayes, among which are the great seal of King George V, the King's Police Medal, King Edward's Medal, and the Scott and Shackleton Medals for the Royal Geographical Society.

Mr. Bayes won the gold medal of the Royal Academy Schools and has work at the Tate Gallery, the collections at Liverpool, Preston, and Dresden, and in the National Art Gallery, New South Wales. His work has embraced every phase of the sculptor's art and he is at the present moment producing some of his finest work.

CORRESPONDENCE.

Advisory Art Committees.

Sir,—I have read with much interest the R.I.B.A. Memorandum under the title of "Advisory Art Committees" in *The Builder* of February 29.

The R.I.B.A. Memorandum does not suggest that the proposed Advisory Art Committees should be made compulsory, but would it not be better if they were, and that external designs for all new buildings must come before and be approved by them? If it were thought best that they should be made compulsory, it would not be a difficult matter for the new Fine Arts Commission to get a Bill through Parliament. To rely on such Committees forming themselves, voluntarily, without power, would still leave this important matter very uncertain in results, to say nothing about many districts which probably would not trouble at all.

I infer from the fourth paragraph of the Memorandum that the R.I.B.A. naturally assumes that the bulk of the members of such Committees would be members of the Institute, and is apprehensive in that case of the delicate operation of the Committees in judging other architects' work that would come up before them, particularly in the case of a plan being submitted by an architect whose own judgment on his design might be more worthy than the whole of the Committee's; and then, again, members of the Committees would very frequently be judging other members' work, but this kind of thing could easily be surmounted by the reasonableness of all parties, and to their general satisfaction.

The paramount and essential work of the Committees would be to make it impossible in future for any more bad or unsuitable architecture, usually designed by people who know nothing about it, or who are grossly indifferent to their own work and any good work in the vicinity. Nothing better could be devised to educate the public in architecture than these proposed Committees. Their very existence would set and demand a better standard than prevails to-day.

J. Jarman.

Mr. Gilbert Bayes, Sculptor. (*See p.* 409.)

ST. PAUL'S BRIDGE

Mr. Harry Gosling, M.P., Minister of Transport, received this week on behalf of the Prime Minister, a deputation on the subject of the proposed new St. Paul's Bridge. The deputation was as follows:—Messrs. Carmichael Thomas, William Davison, David Barclay Niven, *on behalf of the London Society*; S. D. Adshead, W. R. Davidge, R. A. S. Paget, W. Rees Jefferys, *on behalf of the Town Planning Institute*; Ralph Knott, E. Vincent Harris, R. M. Barrington-Ward, James Bone, *on behalf of the Architecture Club*; Harry Barnes, Sir Banister Fletcher, Paul Waterhouse, H. V. Lanchester, *on behalf of the Royal Institute of British Architects.*

Sir William Davison, M.P., introduced the deputation. The deputation urged that the proposed bridge was totally unnecessary, and would in fact, so far from alleviating the problem of London's traffic, cause great congestion in the neighbourhood of St. Paul's Cathedral. The reasons why the bridge should not be constructed were given, and it was suggested that the question of the control of London traffic should receive attention before the building of more bridges was entered upon. It was said that with effective control of traffic the present roads would prove adequate.

Mr. Gosling, in reply, said that the deputation asked him to do a very big thing if they suggested that he should reverse the decision of his predecessors to assist towards the cost of the approaches. Such action would, in fact, be paramount to the Minister hindering the carrying out of a scheme which, after an exhaustive litigation, had received the special sanction of Parliament in 1911. He pointed out that the technical aspect had received very great consideration from the experts and advisers of the Ministers who were wholly in favour of the scheme. He promised, however, that he would carefully reconsider the arguments which had been laid before him.

Town Planning Conference.

An International Town Planning Conference, arranged by the International Garden Cities and Town Planning Association, will be held at Amsterdam, Holland, from July 2 to 9. Principal subjects for discussion will be: (A) Regional planning in relation to large cities; (B) Parks, park systems, and recreation.

"The Plough." (Carved and Pierced Wood Decorative Panel.) Mr. Gilbert Bayes, Sculptor.

Mr. E. Stanley Hall, F.R.I.B.A. (President), occupied the chair at a general meeting of the Architectural Association, at 35, Bedford-square, W.C., on Monday evening.

After the minutes of the previous meeting had been read, the President announced that there were six new nominations for membership, and the following were unanimously elected new members :—

John Burley.	E. de la tour Abrams.
W. S. Newman.	R. W. Lloyd.
L. D. Castelli.	A. V. J. Kirkham.

"The Gothic Survival."

An address entitled "The Gothic Survival" was then delivered by Mr. H. S. Goodhart-Rendel, who said he proposed to talk about the spirit of Gothic as far as it was a thing which was difficult to work out of the English system, and make a few remarks about the present situation of architecture rather than about Gothic in particular. He had recently been looking through a large number of architectural periodicals of the nineteenth century, and thinking about the great difference between the architecture of those days and of the present. One thing he thought very regrettable was the lack of sympathy between most of the veterans in the profession and most of the younger members, and that he thought was a different state of affairs from what existed in other countries where there had not been the architectural upset which had been experienced in this country during recent years. In France there was a certain respect for what might be called "academic" people, but in this country he felt there was a big gulf between the point of view of the average architect and the distinguished men who built the buildings of about thirty years ago. He supposed that was because there was a different way of looking at architecture to-day owing to the upset of the Gothic revival. By the Gothic revival he did not mean a building with Gothic arches, but a great deal of work which was arbitrary and impulsive and designed from the small up to the great rather than from the great down to the small—work in which the accident of building and tradition more or less took the place of purely intellectual work of abstract design. He thought most architects in England were Goths playing with a Classic box of bricks which they did not understand. They would find particular reasons for that in looking at the history of English architecture. It was all very well for them to be proud of their eighteenth-century tradition, but it could not be expected that it would have any European interest. It was less intellectual and more second-hand than the best Italian work, and it was above all more arbitrary; arbitrary from the fact that Classic buildings were built from the outside in. There was no better example of that than Sir Christopher Wren, who packed the inside of his buildings into the elevations somehow or other. There was a very great charm about many of Wren's buildings, but he did not think there was much to be learned from them as to the method of design, and in his opinion they were the worst possible models for any student to study.

He thought Gothic *versus* Classic was a most hopeless thing to argue about, because the words were so arbitrary, and he thought the only distinction they could make was the distinction made by Miss Austen, in her novel, "Sense and Sensibility"—the Latin was sense, and the Teutonic sensibility. If that distinction were taken with architecture, the distinction between the point of view of the man who thought his plan and the whole of his design must be regulated by a cast-iron programme and that nothing must be allowed in the building except what was called for in the programme, and the point of view that the building must be allowed to design itself, would be seen. To allow one's fancy to play over a design and trust to one's self to prevent a falling into wild extravagances seemed a most hopeless way of building. Yet, look through all the past buildings that had been erected and think whether the best could have been built on the rigid Classic system.

They had, he thought, and that was the point of the lecture, to be really eclectic between those two types. At present they were modelling architectural education on the Classic system, but he thought they had to realise that they had to make some little contribution of their own, something which they could work in with the French system, and would make English architecture, not a new beginning, but make it spring over all that mess in the middle of the nineteenth century. The Gothic revival was undoubtedly the main movement in the nineteenth century, and architects of fifty years ago were quite sure that when the pointed arch was rediscovered nobody would go back to nasty things like sash windows. Those architects were not quite fools; the trouble was their exclusive view. Their work was not imitative, except in detail, and he thought the most characteristic Gothic ever produced was produced in the nineteenth century. He did not think Gothic details were worth saving, but he would urge them to keep the general Gothic tradition.

Major H. C. Corlette said he thought the question of plan should be approached in as free a way as the question of the external design. It was impossible to attempt to build from the outside to the inside. He felt that, if the English tradition of the latter part of the sixteenth century had been carried on for another 100 years or so, there might have developed something which was quite extraordinary in architecture in its capacity to express the British point of view. Let them consider whether the English traditions of the latter part of the sixteenth century were not now quite as well worth following as the traditions which the Italians took up in the fifteenth century and the traditions which the Romans developed so magnificently in some of their buildings.

Mr. Gilbert S. Jenkins, Mr. A. S. G. Butler, and Mr. W. H. Ansell also took part in the discussion.

The Wagon: Carved and Pierced Wood Decorative Panel. Mr. Gilbert Bayes, Sculptor. (*See p.* 409.)

BY-LAW REQUIREMENTS

Speaking at the recent Conference of the United States National Housing Association, on "Reducing the Cost of Housing by Eliminating Unnecessary Building Law Requirements," Mr. Ira H. Woolson (Chairman, Committee on Building Codes, U.S. Department of Commerce) made some remarks on local building by-laws, some of which were applicable to this country.

He said an analysis of 134 building codes representing all sections of the United States disclosed that for 1, 2 and 3-story dwellings the thickness of walls required by 60 per cent. of the codes was 12 in., and upwards to 20 in. Similarly, for 4-story buildings, 70 per cent. of the codes required that walls should be 12 in. thick, and upwards to 24 in.

The consensus of expert opinion obtained by the Building Code Committee upon this subject was that such walls were unnecessary for the class of building and the type of occupancy. The Committee, therefore, recommended 8 in. walls for dwellings up to 30 ft. in height, plus a 5 ft. gable.

In the skeleton type of building—that was, where the walls were carried upon the steel or reinforced concrete framework in each story—the Committee's tentative recommendation for all walls, with the exception possibly of fire walls and party walls, was a thickness of 8 in., or a reduction of about one-third on the present requirements in many cities. The Committee's tentative recommendations, if adopted, would reduce the average thickness of walls for the better-class of dwelling construction nearly 10 per cent. for bearing walls, and 20 per cent. for non-bearing walls. Corresponding reductions for industrial and commercial types of building would show a saving of 14 per cent. to 26 per cent., depending upon whether the walls were bearing or non-bearing. There was less reduction in thickness in proportion in bearing walls than in non-bearing walls, for the reason that the bearing wall depended very largely for its support upon its anchorage to the floor system. In case of fire, if the floor system burnt out, these walls became very unstable and consequently dangerous; and the Committee felt that it was not justified in making as great a reduction in thickness for such walls.

Similar reductions would be found—though perhaps not as great a percentage—in walls which were built of hollow tile, concrete block and similar materials.

At existing prices for masonry materials and labour there was opportunity for a very substantial reduction in cost of building, due to the relaxations which the Committee was recommending.

An examination of 109 building codes, fairly representing the country as a whole, disclosed that in 50 per cent. of them the live floor load requirements for dwellings was 60 lbs. and upwards to 100 lbs. per sq. ft.; and an average of all showed 53 lbs. per sq. ft. for the first floor. The consensus of opinion was that these loads were entirely excessive for the class of occupancy.

The Committee recommended 40 lbs. per sq. ft. as ample in ordinary construction, if care be taken to keep unit stresses in structural members within safe limits. A reduction to 30 lbs. per sq. ft. was permitted for monolithic floor construction, or those with ribbed slabs. In joisted construction it was estimated that the reduction in floor load in the dwelling class would permit floor timbers of a given size and quality to increase 10 per cent. in length, or the use of smaller timbers. Either solution promoted economy.

The Committee had gathered a great deal of information upon actual floor loads. For dwelling-house occupancy the average load would not be over 10 lbs. per sq. ft., and in a great many cases less than that. Ten to 15 lbs. would be ample, but, of course, provision must be made for the exceptional loading which might come from crowding of people at the time of some function being held in the rooms. They had recently had an analysis made of a number of dormitory rooms in New York state hospitals, and found that the average actual loading there was only 7½ lbs., and that was under a condition of 25 per cent. congestion.

Equestrian Statue in Bronze at National Art Gallery, Sydney, N.S.W.

Mr. Gilbert Bayes, Sculptor. (*See p.* 409.)

OBITUARY

The death occurred recently of Mr. Leonard Peskett, who was naval architect to the Cunard Steamship Company for a period of forty years. Mr. Peskett became associated with the Cunard Company in 1884, and during his many years' service he had been connected with the design and construction of such vessels as the *Campania*, *Lucania*, *Caronia*, *Carmania*, *Lusitania*, *Mauretania*, *Aquitania*, *Ivernia*, and *Carpathia*.

He was an authority on naval architecture, and had contributed valuable papers to the Institute of Naval Architecture. He had also served on several important Committees dealing with ship construction.

THE ARCHITECTURE CLUB

BRITISH ARCHITECTURE OF TO-DAY

On March 11 the Marquis Curzon of Kedleston opened the second exhibition of the Architecture Club at Grosvenor House.

The President of the Club, Mr. J. C. Squire, who was in the chair, mentioned that Lord Curzon had always had a passionate interest in architecture and was connected with the Society for the Protection of Ancient Buildings.

Lord Curzon, in the course of his remarks, said architecture always seemed to him the most human—almost humane—the most universal, the most cosmopolitan, and the most civilising of the arts. They could not all possess pictures or statuary, but they all lived in a house, and were surrounded by other houses; therefore, they were continually brought into contact with the progress and the art of architecture. If they went to the country they were dependent on the architecture of Nature, but in towns they were confronted with the architecture of man, and he sometimes wondered whether in his experience he had derived most enjoyment from the genius of man or from the architectural works of the Almighty.

Continuing, Lord Curzon said he carried his enthusiasm for architecture to the point of saying he would like to have been a working architect. Why? In the first place architecture needed and demanded no small amount of study and research. Above all, in architecture there was scope for creative power and human imagination. Also, architecture could be practised both indoors and out of doors. Further, they had the most wonderful set of models and materials the world could produce. Painters were confined to paint, sculptors to marble and bronze; but architects could use all the stones the world produced, every species of marble and every metal, and could combine them in any proportion or degree they pleased. Then let them look at the scope and range of the architect. He might be called upon to draw plans from a cathedral to a horse-box; from a castle to a cow-shed.

In regard to the prizes of the profession, if they put up a bad building they were damned, but if they were successful there was the building—always visible to the world. Those were some of the reasons that had led him to such an interest in, and enthusiasm for, architecture. It was true he had been born and lived in an English house (Kedleston) which was a great monument of architecture: probably the finest existing example of the earlier style of the great Robert Adam.

In regard to the position of architecture to-day, Lord Curzon questioned whether it was on the upward grade, stationary, or whether it had gone down. It was difficult to answer dogmatically, but those who had studied the matter at all would understand that the movement of architecture was distinctly and admittedly a movement in advance. There were one or two indications that the interest in and knowledge of architecture were much more widely spread than 30 or 40 years ago.

He was not certain, however, that the cultured classes took such an interest in architecture as in the time of the great men of the eighteenth century. After referring to the good work of various publications dealing with architecture, Lord Curzon said the answer to the question as to whether they were capable of producing any new national style of architecture was doubtful. If they examined the architectural history of their country they would find architecture had expressed the tastes of the time in a manner strikingly national. When the Normans came upon the scene they brought their castles with them, but castles strikingly Continental. The manor houses of England, whether of timber or stone, in the thirteenth, fourteenth and fifteenth centuries, were among the most purely national things the country had ever produced. Some of the late Tudor mansions were among the most beautiful things in the world; imitations were no good at all. Then they had the Elizabethan and Jacobean styles, and a little later the Renaissance, which gave them Inigo Jones and Christopher Wren. The time of William and Mary was a magnificent period of British art. The red-brick and stone buildings (Queen Anne and the later Georges) expressed original English architecture.

So, continued Lord Curzon, we came down to the last century. No one would contend that there was such a thing as Victorian architecture. Could they have, at the present time, taking the name of the King and Queen, a George and Mary style? Plenty had tried, but he thought, on the whole, without success; perhaps the conditions did not admit of a new style. They had to take the old styles, alter them, readjust them, so that, by a sort of imaginative eclecticism, they created a new. Architecture in America was an example of this method, and he considered it the best in the world—turning out some of the finest modern architecture that the world could show. To what extent could we do the same? If they looked at the public buildings they would see how they succeeded. He did not wish to say anything about our public buildings, museums, libraries, &c. Probably the nadir of inferiority was reached in the building known as the Admiralty, the most melancholy emanation of human genius that had ever been seen.

The possibilities of creating great country houses were at an end; people had not got the money to do it. The *nouveau riche* did not want beauty, but luxury and comfort—a winter garden, squash racket courts, and swimming baths. It was impossible for a good country house ever to be built again.

The smaller class of modern house, as designed by Sir Edwin Lutyens and his contemporaries, was the creative triumph of the present generation. The two disastrous failures of modern architecture were the cottage and the villa. Why was it that the cottage which, 400 years ago, was the most beautiful thing in the world, had been replaced by the modern building? Probably architects had nothing to do with it; probably the building speculator was responsible for these horrors. He would like to see architects turn their attention to building a better style of cottage. In regard to the villa, was it not almost incredible that they should perch these execrable creations in various parts of the country? It was not, however, confined to England alone. Perhaps architects, in the interval of their labours, would be able to give something not invariably ugly.

Continuing, Lord Curzon said if he had been able to carry out his natural instinct and had become an architect, he would have suggested the following rules should be preserved: Use an English style in England, do not build a French chateau looking over an English countryside; let dignity and moderation be the guide of their work; avoid megalomania; avoid buildings that climbed into the sky; avoid aggressive individualism.

Referring to Regent-street, Lord Curzon said, in conclusion, that now it had been pulled down it lacked combination. He was sorry for Nash, who had a knowledge of form, and had made Regent-street sober, demure, and an artistic whole. It was a permanent loss to the country that the Regent-street of Nash had gone.

Finally, they should use the simplest and best materials. Above all, they should avoid pretension and sham; and it was essential not to forget the æsthetic side.

On the motion of Mr. O. Milne, seconded by Mr. H. Child, a vote of thanks was accorded to Lord Curzon.

We do not find quite the same amount of interest in the second exhibition of the Architecture Club as distinguished the first, and it is evident that for some cause or other there is a difficulty in getting much of the best work together. We miss the work of many able architects. In two of the sections—those of Housing and Memorials—we should have hoped to see a much higher average of quality. The housing exhibits are probably above the average quality of the large amount of housing work already done, but we have seen a good deal of cottage building of much better sort than the bulk in this collection. Amongst the best shown are the pleasing examples from the Cushencan Village, County Antrim, by C. Williams-Ellis; houses at Swanport, Lincoln, by Hennell & James; a striking panoramic view of houses at Edmonton, by Niven and Wigglesworth; and Dover Housing Scheme by Adshead, Ramsey & Houfton. One of the photographs of the latter shows that a good proportion really can play a part in cottage design. Amongst the collection of War Memorials we find little evidence of any inspiration and hardly anything of those which have actually realised any distinction. The model of the Aberdeen Memorial, by Messrs. Mackenzie, is unfortunately placed so that the dome comes into undue prominence; it should have been placed at a much higher level, so that its quality of dignity and distinctive emphasis would have been made more apparent. We like the simple, pleasing effect of the Village War Memorial at Drayton, by H. M. Fletcher. We do not like the fashion of crosses with truncated arms, nor the effect of an elaborately decorative memorial with no better setting than an old brick wall.

Amongst the models we find two or three attractive ones of modern houses, such as that of a Riverside House, Bray-on-Thames, by Baillie Scott & Beresford, and the Ugborough Vicarage, Dartmoor, by P. D. Hepworth. The models of old cathedrals, lent by the Dean and Chapter of Canterbury, are very interesting; some such collection would surely be of educative value to our schools of architecture as studies of mass and outline. Amongst the illustrations of modern architecture we greet some old friends, and if we find nothing exceptionally striking, we may at least enjoy a sight of many suggestive examples of domestic architecture. The house for Mr. Parsons, at Welwyn, by Louis de Soissons & A. W. Kenyon, is the sort of simple Georgian work one never tires of, and a simply-treated garden corner at Dalingridge-place, West Hoathly, by Wratten & Godfrey, is a delightful example of quiet charm contributed by an unusually excellent photograph. It is pleasant to find such a nicely treated brick building as Lloyds Bank, Cheam, by Edward Maufe. For the acme of richly-treated woodwork we may turn to several examples by Sir Robert Lorimer, at Eton College and elsewhere. It would be beyond the bounds of our available space even to mention all the exhibits of genuine interest.

That an exhibition of architectural work such as this, which has cost considerable effort to bring together, is fairly representative of the art of architecture as practised to-day, it is impossible to admit, unless perhaps it be in the way of domestic building, for the best kind of commercial or public buildings is very inadequately shown. One of our best modern buildings of a public sort is the University block, by Messrs. Wills & Anderson, at Cardiff, illustrated by an excellent photograph. This has, however, been built some time. Messrs. Trehearne & Norman's Bryanston House, Dorset-street, is a good example of sensible, pleasing treatment of a more recent date. The fact is that there is seldom an adequate representation of the best modern work, such as, for instance, could be obtained by a view looking down the east end of Aldwych, which would have for the left side of the picture a fine range of buildings by Trehearne & Norman, leading down to Sir John Burnet's admirable Insurance building; whilst the right flank would show one of our most satisfactory modern buildings, Australia House, by A. G. R. Mackenzie; and in the distance beyond Mr. H. T. Hare's Insurance block; whilst a central feature in the view is St. Clement Danes, and beyond is seen a peep of Street's Law Courts. We know of nothing in modern London which might go so far to prove our modern quality, and we are sure that a fine view of all this done to a large

scale would prove that there are some grounds for satisfaction with out modern efforts. Already we are able to visualise the impressiveness and dignity which will be found when we get the ultimate result of Mr. Selfridge's finely conceived store in Oxford-street, which, when completed, will rank with the finest buildings of its kind in the world. We may criticise as we please the appropriateness of such a building as the home of retail trade, but, after all, such a structure is so large and impressive in its way that it does seem to add something of definite value to our wonderful Oxford-street, which for miles is only one long drawn-out jumble of fussiness and vulgarity.

Everyone who goes to the exhibition will find for themselves, according to their degrees of appreciation, what is of special interest. The illustrations of domestic work which we have not seen before include admirable things by Messrs. Forbes & Tate, Baillie Scott & Beresford, Oswald P. Milne, H. M. Fletcher, P. D. Hepworth, L. L. Dussault, Nathaniel Lloyd, Wratten & Godfrey, John D. Clarke, and C. Williams-Ellis. Mr. G. Gilbert Scott again claims first notice in ecclesiastical work, but this section of the exhibition is not a very strong one. The models of garden figures include one or two good pieces like Harold Stabler's fine "Harpy Eagle." There is at least a better feeling of selection in the general character of the exhibition than we find in other exhibitions of architecture. Our notes are necessarily too short to refer to many exhibits which go to the credit of modern architecture.

The late W. H. Ward.

The Late W. H. Ward.

MR. WARD, who was taken ill on Friday last week, and died on Monday following an operation, was born in 1865. He was articled to Sir A. Blomfield, and was later with Messrs. Ernest George & Peto and Sir Edwin Lutyens. He received the R.I.B.A. Measured Drawings Medal in 1905. His works included several houses and war memorials, St. Peter's School, Weston-super-Mare, and, in partnership with W. G. Cogswell, Emmanuel Church, Liverpool. His principal publications were "French Chateaux and Gardens of the XVI Century," "Architecture of the Renaissance in France," etc.

THE LATE W. H. WARD, F.R.I.B.A.

AN APPRECIATION BY A. E. RICHARDSON

I AM asked to write an appreciation of an architect whose passing will be deeply regretted by all to whom he was known, as well as by that wider circle which accepted his writings as authoritative. I am willing enough to write but have not the materials wherewith to compile an ordinary obituary notice. My note of appreciation shall be fully charged regarding Ward's attainments and influence on the profession at large, for now that he is gone he will be generally recognised to have been a great figure.

The years pass swiftly like fleeting milestones on the highway of life; they pass with even greater speed in such intimate quarters as professional circles; and thus it is that we are shocked when some friend drops out of the orbit to be seen no more. Ward was a man of dignity, a scholar and an artist. He had, too, the reticence of the student, but on the subject of historical architecture he was expansive. No more will his signature be attached to articles in the Press, we shall look in vain for the books he should have lived to indite, for it need be no secret now that more than one publisher was eager for the honour of dealing with him. My first acquaintance with Ward began in the inner library at Conduit-street fourteen years back, when, by an odd chance, I disturbed the gentle student, for thus he appeared, and never lost the look, by dropping some dusty books from the top case. He was very gentle about the disturbance and went on with his work, which to judge from the volumes spread on the table, seemed to be a gigantic task. I made a few discreet inquiries and found that I had unwittingly tried a scholar. At that time Ward was putting the final touches to what was destined to be his chief work, "The Architecture of the Renaissance in France." From Gerald Ince, Ward's Cambridge friend, I subsequently gathered details of his prowess at College, his gift for impromptu verse, and his skill as a writer. Little did it occur to me that the years would pass all too swiftly, and that I should, through closer acquaintance with this distinguished man, cherish incidents which at the time appeared trivial. Through the good offices of Herbert Batsford I got to know Ward intimately and understood his thoroughness by hearing the eulogies of his enthusiastic publisher. As I write I can hear Herbert Batsford say: "Ward is the most thorough man I know; he can write, too; the matter in his new book is delightful. I want him to write a new history of Italian architecture; he is the man for a revised edition of Greece and Rome and anything else I can find for him." The years pass, the books remain unwritten, the voices are silent. It so happened that I was in Herbert Batsford's room on the morning when the first edition of the French book came from the bookbinder, and I am pleased now to think that the first two volumes sold came direct to my hands.

On the outbreak of war, Ward, who was then fifty, but looked slightly younger, lost no time in enlisting and gave his age, a pardonable sin, as 36. He was in the trenches at the very worst time before comforts were usual, and after useful service he was invalided; but he did not give up his soldiering, for later on he got patched up and held an important post at Amiens.

I regret the loss of this architect and historian, and I am certain his loss will be universally regretted. Who is to take his place? The old order of writers is giving place to others who have not the necessary patience, the ripe erudition, or the balance, to serve as historians of the art. Ward was the complete embodiment of the University spirit. His chambers in Bedford-square had all the character and atmosphere of the quarters of a don. It has been my privilege to sit with him on committees and faculties, to meet him in the quadrangle at Gower-street—for he took an interest in the doings of University College, and only a few weeks since attended a Board of Studies. It was Ward's one regret that he got too little architecture to do; he felt the lack of commissions, purely because he realised that it was in his power to do work of any description if the chance came his way. What he did accomplish shows that he was an artist with a soul above monetary considerations. Books were his solace—books and study. His tastes led him instinctively to the study of French art, and it was only after years of travel in France and Italy that he made up his mind to deal exhaustively with the history and development of French building during four centuries. One feels that, if Ward had had the chance of projecting a monumental building he would have conceived it in that largeness of handling which was a feature of the epoch of the Grand Monarch! But he also realised that England, too, could show an architectural style, and as secretary of the Wren Society he did much useful pioneer work to make the aims of the Society known.

Ward is dead, we have lost a friend; but his works live and gain an increased radiance, because we shall not see the like by the same pen. There are some who will remain indifferent to the lesson of a scholarly life; some, too, mayhap, who will never take the trouble to profit by so much sacrifice of leisure on the part of one who suffered ill-health. Ward never talked about himself; he set no store on his ability, but just worked and wrote, attended this or that meeting as a duty, and maintained a cheerful nonchalance to all the busyness of the commercial battle outside.

It is a pity, for he was young-looking—that is, as age is accounted in these times. He was unaware of the respect and love of those who knew him intimately—he would have been the first to resent it; but death is an excuse for an outpouring. When such an one dies, his memory flares up like a beacon, all his labours and sayings become poignant as exemplars. I can see him now as my pen attempts homage—a dignified figure with the slight stoop of a scholar, and the mind of a gifted youth.

New Premises for Messrs. Brinsmead.

No. 17 Cavendish-square was formerly the residence of the Earl of Bessborough. The showroom front in Wigmore-street has been inserted for Messrs. Brinsmead, and the Adam treatment carried through the whole of the ground floor of this façade to make a cohesive elevation. Mr. Gilbert Bayes modelled the figures of "Art," "Science," and "Music," and the panel of the children. A special colour treatment has been carried out in a burnt sienna with ivory relief sculpture. The columns and doors are polished mahogany, and the steps white Sicilian marble.

Frieze, "The Children's Orchestra," at Messrs. Brinsmead's New Premises.
Messrs. Bennett & Hossack, Architects; Mr. Gilbert Bayes, Sculptor.

Internally, the ground-floor showroom is panelled and has green walls, red and gold doors, a buff ceiling and frieze, and a polished floor. There is a full-length posthumous portrait in oils of John Brinsmead by Mary Edis. The first-floor showroom is decorated as an Adam room with grey walls in two shades with white flat enamel paint, a frieze of ivory tinged with sienna, and a white ceiling with cobalt blue ground to a portion of the enrichment. The corridors are green and black with a white frieze, and the studios yellow and black and orange and black with a small Chinese band at the frieze level. The lift cage is specially designed by the architects in mahogany and ebony.

The heating was installed by Messrs. William Freer, Ltd.; lift by Messrs. Marryat-Scott; lighting by Messrs. Duncan Watson, Ltd.; Adam ornament to front supplied by Messrs. Jackson & Son, Ltd.; general building work by Messrs. L. H. & R. Roberts; construction of the front and the whole of the decorative work by Messrs. Green & Abbott, Ltd. The sculpture reliefs are by Mr. Gilbert Bayes. The architects are Messrs. Bennett & Hossack. F. and A.R.I.B.A., 41, Bedford-row, W.C.1.

Royal Masonic Institution Junior School.

We give this week the design submitted in the recent competition for a Junior School at Bushey for the Royal Masonic Institution, by Mr. C. J. Dawson, F.R.I.B.A. The design placed first, by Messrs. Davis & Emanuel and Henry C. Smart, was given in our issue for February 22, and other designs submitted were given as follows: Messrs. Gotch & Saunders, February 29; Messrs. W. & T. R. Milburn, March 7.

MEETINGS.

Friday, *March* 14.

London Society.—Mr. B. Chancellor on "Royal Residences in London." At 18, John-street, Adelphi, W.C.2. 5 p.m.

Monday, *March* 17.

Royal Institute of British Architects.—Mr. H. Bagenal on "Planning for Musical Requirements." At 9, Conduit-street, W.1. 8 p.m.

Institution of Structural Engineers.—Annua Dinner. At the Criterion Restaurant, W.1 7.30 p.m.

Tuesday, *March* 18.

Liverpool Architectural Society.—Mr. L. B Budden on "The Relation of Architecture to the Arts." At 13, Harrington-street.

Society for the Promotion of Roman Studies.—Major G. Home on "Some Lesser-Known Roman Towns in Algeria and Tunis." At Burlington House, Piccadilly, W.1. 4.30 p.m.

Wednesday, *March* 19.

L.C.C. Central School of Arts and Crafts.—Sir Banister Fletcher on "Early Christian Architecture." At Southampton-row, W.C.1. 6 p.m.

Thursday, *March* 20.

Society of Antiquaries.—Final Report on the excavation of the Anglo-Saxon Cemetery. At Burlington House, Piccadilly, W.1. 8.30 p.m.

Town Planning Institute.—Mr. F. M. Elgood on "Buildings and Building Lines, Including Zoning." At the Institution of Mechanical Engineers, Storey's Gate, S.W.1.

Architecture Club Exhibition.

[Mr. E. Vincent Harris, F.R.I.B.A., was the Assessor in this Competition.]

REVISION OF THE REGULATIONS FOR ARCHITECTURAL COMPETITIONS

A special general meeting of the Royal Institute of British Architects will be held on March 18, at 5.30 p.m., to consider the revision of the existing Regulations for Architectural Competitions prepared by the Competitions Committee, in consultation with the allied societies and the Society of Architects, and approved by the Council.

The new Draft is as follows:—

It is assumed that the object of the Promoters is to obtain the best design for the purpose in view. Where the Promoters desire to achieve this end by means of a Competition experience shows that the object may best be secured by conducting all Competitions upon the lines laid down in the following Regulations, which have been framed with a view to securing the best results to the Promoters with scrupulous fairness to the competitors.

Members and Licentiates of the Royal Institute of British Architects, Members of its Allied Societies and Members and Licentiates of the Society of Architects do not compete excepting under conditions based on these Regulations.

The Conditions of a Competition shall contain the following Regulations (*a*) to (*f*) as essential:—

(*a*) The nomination for every Competition of an Assessor or Assessors who shall be Architects of acknowledged standing to whom the whole of the designs shall be submitted.

(*b*) Each design shall be accompanied by a declaration signed by the competitor, or joint competitors, stating that the design is his or their own personal work, and that the drawings have been prepared under his or their own supervision. A successful competitor must be prepared to satisfy the Assessor that he is the *bona fide* author of the design he has submitted.

(*c*) No Promoter of a Competition, and no Assessor engaged upon it nor any employee of either shall compete *or assist a competitor*, or act as Architect, or joint Architect, for the proposed work.

(*d*) The premiums shall be in accordance with the Assessor's award and the author of the design placed first by the Assessor shall be employed to carry out the work, unless the Assessor shall be satisfied that there is some valid objection to such employment, in which case the author of the design placed next in order of merit shall be employed, subject to a similar condition. The award of the Assessor shall not be varied for any other reason.

(*e*) If no instructions are given to the author of the design selected by the Assessor to proceed within twelve months from the date of the award, then he shall receive payment for his services in connection with the preparation of the Competition drawings of a sum equal to 1½ per cent. on the amount of the estimated cost* up to £50,000, but if the estimated cost of the work exceeds £50,000, he shall be paid a sum equal to 1½ per cent. upon the first £50,000 plus ½ per cent. upon any sum in excess of that amount. The first premium shall be deducted from the sum so paid. If the work is subsequently proceeded with this sum shall form part of his ultimate commission.

(*f*) The selected Architect having been appointed to carry out the work shall be paid in accordance with the Schedule of Charges sanctioned and published by the Royal Institute of British Architects, and the premium already paid shall be deemed to be a payment on account.

1. The Promoters of an intended Competition should, *as their first step*, appoint one or more professional Assessors, Architects of acknowledged standing, whose appointment should be published in the original advertisements and instructions. The selection of an Assessor or Assessors should be made with the greatest possible care, as the successful result of the Competition will depend very largely upon his experience and ability. The name or names of the Assessor or Assessors should always appear in the conditions governing a Competition or in any advertisement or other announcement relating thereto.

The President of the Royal Institute of British Architects is always prepared to act as honorary adviser to Promoters in their appointment of Assessors.

2. The duties of an Assessor are as follows:—

(*a*) To confer with and advise the Promoters on their requirements and on the questions of cost and premiums to be offered.

(*b*) To draw up instructions for the guidance of competitors and for the conduct of the Competition, incorporating the whole of the clauses of these Regulations which are applicable to the particular Competition.

Note.—It is essential in drawing up the Instructions to state definitely which of the conditions must be strictly adhered to, under penalty of disqualification from the Competition, and which of them are optional.

(*c*) To answer queries raised by competitors within a limited time during the preparation of the designs, such answers to be sent to all competitors.

(*d*) To examine all the designs submitted by competitors and to determine whether they conform to the conditions and to exclude any which do not.

(*e*) To report to the Promoters on the designs not so excluded and to award the premiums in strict accordance with the Conditions.

(*f*) To inform the Promoters if necessary that modifications may be made in the winning design by the successful Architect, if so desired by the Promoters.

3.—Competitions may be conducted in one of the following ways:—

(*a*) By advertisement, inviting Architects willing to compete for the intended work to send in designs. *For Competitions for Public Works this method is recommended.*

(*b*) By advertisement, inviting Architects willing to compete for the intended work to send in their names by a given day, with such other information as they may think likely to advance their claims to be admitted to the Competition. From these names the Promoters, with the advice of the Assessor, shall select a limited number to compete, and each competitor thus selected shall receive a specified sum for the preparation of his design.

(*c*) By personal invitation to a limited number of selected Architects to join in a Competition for the intended work. Each competitor shall receive a specified sum for the preparation of his design.

Note.—Where a deposit is required for supplying the Instructions it shall be returned on the receipt of a *bona fide* design, or if the applicant declines to compete and returns the said Instructions within four weeks of the date for submitting designs.

4.—The number, scale and method of finishing of the required drawings shall be distinctly set forth. The drawings shall not be more in number or to a larger scale than necessary clearly to explain the design, and such drawings shall be uniform in size, number, mode of colouring and mounting. As a general rule a scale of 16 ft. to 1 in. will be found sufficient for plans, sections and elevations, or, in the case of very large buildings a smaller scale might suffice.

Unless the Assessor advises that perspective drawings are desirable they shall not be admitted.

5.—No design shall bear any motto or distinguishing mark; but all designs shall be numbered by the Promoter in order of receipt.

6.—A design shall be excluded from a Competition:—

(*a*) If sent in after the period named (accident in transit excepted).

(*b*) If it does not give substantially the accommodation asked for.

(*c*) If it exceeds the limits of site as shown on the plan issued by the Promoters, the figured dimensions on which shall be adhered to.

(*d*) If the Assessor shall determine that its probable cost will exceed by 10 per cent. the outlay stated in the Instructions or the estimate of the competitor should no outlay be stated.

(*e*) If any of the Conditions or Instructions other than those of a suggestive character are disregarded.

(*f*) If a competitor shall disclose his identity or attempt to influence the decision.

7.—All designs and reports submitted in a Competition, except any excluded under Clause 6, together with a copy of the Assessor's Award, should be publicly exhibited for at least six days. Due notice shall be given to all competitors of the date and place of such exhibition. It is desirable that competitors should be furnished with a copy of the Assessor's Award.

8.—All drawings submitted in a Competition, except those of the design selected to be carried out, shall be returned carriage paid to the competitors, within fourteen days of the closing of the Exhibition.

The usual R.I.B.A. Scale of Charges for Assessing Competitions is the sum of Fifty Guineas, plus one-fifth per cent. upon the estimated cost of the proposed building.

In the event of more than *one Assessor* being appointed, the remuneration shall be decided by mutual arrangement between the Assessors and the Promoters.

The Conditions of a Competition issued by a Corporate Body should have the Common Seal of that Body fixed thereto.

* The amount of the estimated cost means the amount stated in the Conditions of the Competition.

EXHIBITION NOTES.

The exhibition of buildings and paintings at the Suffolk-street Galleries, where three galleries are filled with photographs of Mr. Delissa Joseph's buildings, and two, including the large gallery, are occupied by Mrs. Delissa Joseph's paintings, suggests that other architects might follow suit and give us an epitome of their doings—though few would be able to compete with this large exhibition of executed work. With most of the buildings probably a large number of our readers are familiar, but the photographs often show them in a new aspect and with the adventitious charm of trees and figures. The pictures by Mrs. Joseph evidence a practised hand, and many of them have decided charm of colour and light.

Pencil Drawings.

As one calls to mind the beautiful pencil drawings which have been made during the centuries and the many excellent reproductions of such, one is rather in doubt whether it was worth while to publish four pencil drawings in a little brochure entitled "Pencil Drawing" (by Charles Marriott), at a published price of 5s. The drawings are hardly the best work of their authors. Messrs. Emanuel, Fletcher, Gillett and Thomas. "The Zwolle," by Frank L. Emanuel, and "Norwich," by Hanslip Fletcher, have some excellent quality, but when there is such a wealth of beautiful pencil drawing to be seen to-day, the object of this small collection is a little difficult to understand.

ARCHITECTURAL SOCIETIES

NORTHERN ARCHITECTURAL ASSOCIATION.

On February 23 Mr. Arthur Stratton lectured before the Northern Architectural Association at Newcastle on "Dutch Architecture and Its Influence on English Architecture in the Seventeenth and Eighteenth Centuries."

In the course of his lecture he showed the gradual development and charm of the native work in spite of the difficulties of cramped sites and the flat, uninteresting nature of the landscape, and demonstrated how cleverly the Dutch architects had turned their greatest difficulty, viz., water, into a valuable and picturesque asset, and how, by their clever and varied treatment of gables, they had successfully overcome the difficulty of their narrow frontages.

Continuing, he showed how the Dutch domestic style of the eighteenth century strongly influenced English architecture of the so-called Georgian period, commenting on the fact that though the Dutch and the English were continually at war practically during the whole period trade between the two nations must have been great and almost continuous. The lecturer also suggested a further means of influence, viz., the dissemination of folio books containing plans and elevations drawn to scale by Dutch architects, many of which books found their way into England, and drew attention to the fact that although Sir Christopher Wren had never been in Holland many of his designs, including some of the steeples for his City churches, were inspired by the work of Holland, and drew to their notice the great charm, and the foil made by the graceful steeple of St. Martin's, Ludgate, to the dome of St. Paul's Cathedral.

By means of many slides his theory of the Dutch influence upon English work was strongly reinforced, and the lecturer pointed out the aptitude of the English to assimilate to their own purposes the good and suitable of the work of other nations, without adopting the native extravagancies which eventually crept into a style. England was fortunate to possess this faculty.

The lecturer concluded by saying that during his recent visit to Holland he had been greatly struck by the large amount of really fine architectural work now being carried out there. This was being done to a large extent by the older practitioners, who were successfully evolving a modern and national style based on simplicity and a thorough knowledge and appreciation of the old. Unfortunately, there was a second school, mostly composed of young men full of ideas and of great cleverness, but whose work showed lack of scholarship, and could only be described as extravagant and unbalanced.

ROYAL INSTITUTE OF ARCHITECTS OF IRELAND.

The Royal Institute of the Architects of Ireland recently held their annual dinner at the Shelbourne Hotel, Dublin.

Mr. George Sheridan, the president, proposed the toast of "Prosperity to Ireland."

Senator Douglas, who responded, said they were at a stage when they had to plan and construct in order to meet what had been a mania of destruction. They had to define a policy of construction, and if, in the next few years, the wish of prosperity to Ireland was to be translated into reality, every man must put his very best into his work.

Mr. R. M. Butler proposed the toast of "The Learned Professions."

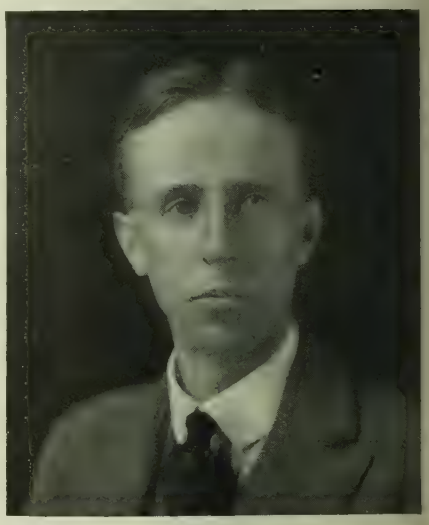
The Attorney-General (Mr. H. Kennedy, K.C.), responding, said that a new Ireland was starting upon its way, an Ireland which they hoped would offer not to one profession, but to all, a degree of prosperity and happiness that had never been known in the past.

Mr. C. St. J. Orpen, proposing the toast, "The Fine Arts," mentioned that in that country people suffered too much from the paralysing effect of criticism.

In responding, Senator Yeats said that he thought he had recently seen the most wonderful architectural sight in the modern world—the great Town Hall of Stockholm. To them in that half-ruined city of Dublin it was an example of what a city could do in re-building. He had seen three great modern buildings—Philadelphia Terminus in New York, the Catholic Cathedral at Westminster, and the great house in Stockholm, which was the greatest of the three. At the Catholic Cathedral of Westminster they found how to make or mar a great building; they had there the great idea of the architect ruined by inartistic decoration, and the most ignoble and incompetent was the Chapel of St. Patrick put up by the public subscriptions of Irishmen. The fact that every man who paid his guinea must have a guinea's worth of influence was the very antithesis of art. The Swedes were now the greatest decorators in the world. Before the war the Budget of Sweden was very little more than the Budget of Ireland—it was only half a million more. The population of Sweden was six millions. The Swedes were one of the two most educated nations in the world. Denmark was the other. As they had no coal the people in the Free State would not produce manufactures in great volume. The making of great buildings of the kind he had described would have an effect on the whole nation.

Mr. Dermod O'Brien, also responding, alluded to the observations that had been made about construction, and said that there were various snares that he would like to warn everybody against. Two of these were, novelty in expression in different forms and a vulgarising of a good many of the arts by allowing them to become purely mechanical.

ROMAN AMPHITHEATRES.



In a recent lecture at the Central School of Arts and Crafts Sir Banister Fletcher dealt with theatres, amphitheatres, and circuses, as providing necessary amusement for the social life of Roman citizens. Roman theatres were founded, he said, on Greek theatres, and were, indeed, often adapted from them; but the different genius of Roman drama required certain important changes of plan. The old Greek orchestra became unnecessary, and the space for chanting and dancing was now given up to stalls for spectators; while the increase in the number of actors brought about a corresponding enlargement of the stage. The oldest and most magnificent of Roman theatres was the ruined Theatre of Marcellus, begun by Julius Cæsar and finished by Augustus, and it was the only one known that was built on a level site entirely above ground. This great building was interesting in the history of architecture, for the Doric and Ionic orders were placed one over the other, and used not constructively but decoratively. It was, therefore, a fine example of Roman motif in design, which was a composite form, combining as it did the use of wall, arch, and order, which were the essence of Roman building design as distinct from Greek.

But the mimicry of the stage failed to satisfy the virile Roman race, which revelled in fierce physical combats between men and wild beasts, and for these displays great oval amphitheatres were built, which were entirely Roman in origin, and carried out with that wonderful mastery of intricate detail in plan and construction which could be studied to-day in the ruins, still stupendous in their size and grandeur, of the Roman Colosseum, one of the most celebrated structures in the world, remaining to-day a mute but impressive memorial of the grandeur that was Rome.

LIVERPOOL SCHOOL OF ARCHITECTURE

In our last issue we briefly mentioned that the title of Associate Professor had been conferred upon Mr. Budden, of the Liverpool University School of Architecture. Mr. Budden was born in 1887, and educated at Merchant Taylors' School, Crosby, and at Liverpool University. He entered the School of Architecture there in 1905, and graduated with First Class Honours in Architecture in 1909. He was awarded the Holt Travelling Scholarship and University Scholarship in Architecture, and was a student at the British School at Athens, 1909-10. In the latter year he took his M.A., and was appointed studio instructor in the School of Architecture. A year later he became assistant lecturer, first in the history, and afterwards in the theory, of architecture. In 1913 he became an Associate of the Royal Institute of British Architects. Rejected on medical grounds for war service, he was in 1915 elected a member of the Faculty of Arts, and was in charge of the School of Architecture (in the absence of the Professor) until 1919.

In 1919 he became senior lecturer in the Theory and Practice of Architectural Design. After being convenor to the Board of Studies in Architecture and Civic Design, Mr. Budden became chairman of that body for 1921-22.

Mr. Lionel Budden.

He was chosen as Liverpool's representative of Associates of the R.I.B.A. to serve on the London Committee on Architectural Registration, and was appointed by the R.I.B.A. thesis examiner in design for the final examination of that body. In 1923 he was elected to the Council of the Liverpool Architectural Society.

Mr. Budden occupies a high position in his profession. His work is marked by refinement and taste, and as a teacher his achievement has been very notable. Recently he won a competition for the Birkenhead War Memorial, while with Professor Abercrombie several years ago he was second in an open competition for replanning the centre of Bradford and for redesigning its street façades. At the School of Architecture he is responsible for the theory of design, and the Royal Institute of British Architects awarded him its medal for his "Introduction to the Theory of Architecture." In addition to the competitions mentioned, Mr. Budden (in collaboration with Mr. H. J. Rowse) was first in that for work at King's College, Cambridge.

The White Star Co. has founded an annual prize of ten guineas, in the Liverpool School of Architecture, for the design of a portion of the interior of an Atlantic liner.

ARCHITECTURE AND CONCRETE

Mr. Maxwell Ayrton lectured recently on the importance of reinforced concrete in architecture.

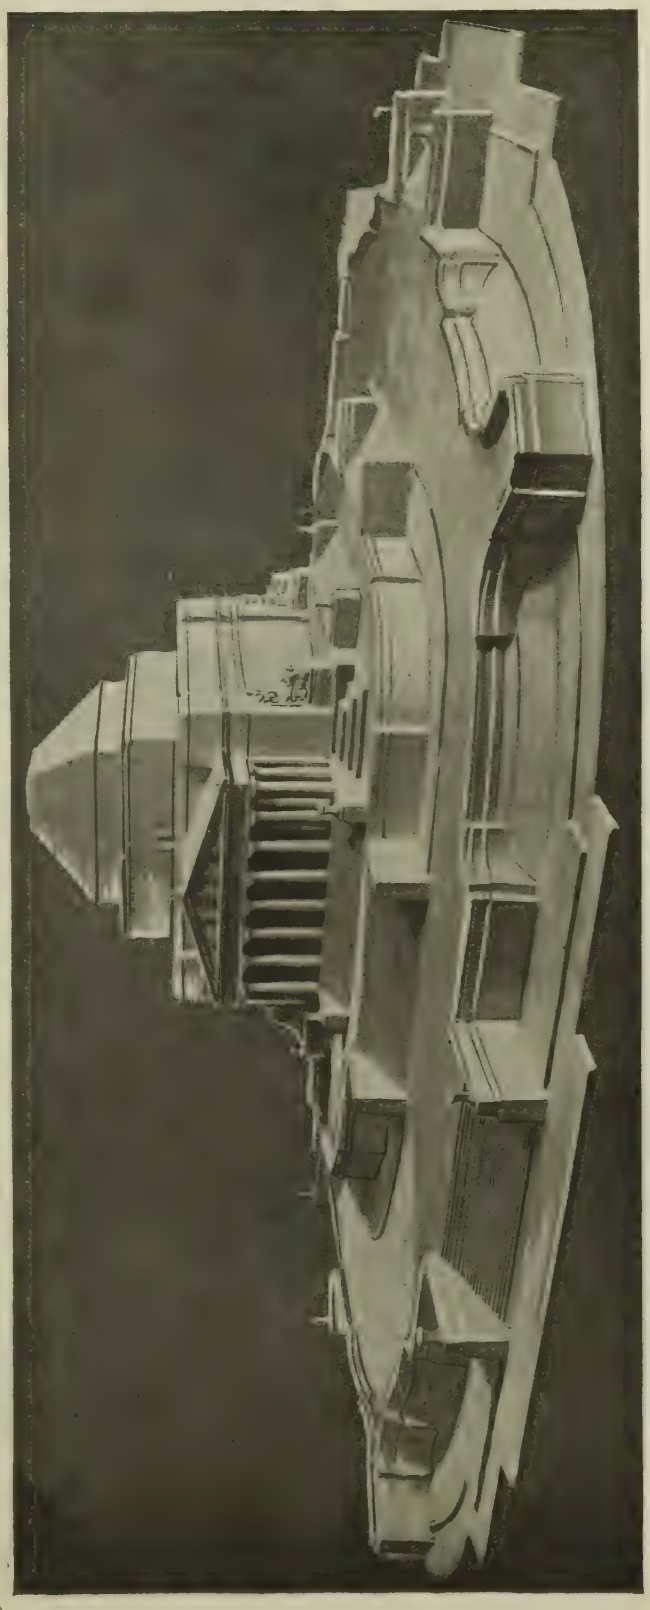
The lecturer, in the course of his remarks, referred to the efforts of science to keep in touch with the changing conditions and requirements of the times, and said it was, perhaps, more apparent in the world of design than in any other science, particularly with regard to the introduction of iron and steel into building construction and design generally. The great changes effected in recent years had tested the genius of both engineer and architect, and acting together they had produced wonderful work; but there were still many difficulties to be overcome. The close union between architects and engineers would, however, before long remove all obstacles that stood in the way of complete success in the use of reinforced concrete. The great objection to concrete in the past had been that, when the boarding was taken down, the impression of the boards remained.

As the use of this material became more general, practically a new trade would be created—that of the skilled maker and fixer of shuttering, the man who would know in an instant, when he saw an architect's detail drawings, exactly how he was to set about making his moulds and shuttering, and exactly what would and what would not make a good job, just as at the present time a first-class pattern maker for steel and iron was able to correct in a moment an error in judgment on the part of the designer should he have made one.

The possibilities of reinforced concrete were immeasurable, and its advantages over others many, among the greatest being that of speed. It was conceivable that, when the architect and engineer had sufficient time to complete the drawings for a building down to the last detail, they might bring this manipulation to so fine a point that when the day came for the striking of the shuttering the building should be complete, and need no further finishing than the necessary hanging of doors and putting in of windows and painting.

The lecturer mentioned a few of the problems awaiting the architect, and said perhaps the most difficult was the satisfactory management of the expansion joints. Steel and cement expanded and contracted equally and together; otherwise, of course, reinforcement of concrete would be impossible. That necessitated expansion joints at regular intervals. In some cases it was possible to cover the joint by an overlapping projection. No rule could be laid down; it was one of those points in which it was absolutely essential that the engineer and architect should work in harmony. The "mix"—that was, the composition of the concrete, and, in particular, the amount of water used—was of the greatest importance in the texture of the face of a building. The aggregate used was a matter settled by the local conditions. That and the colour of the sand used determined the colour of the finished work.

Another point to consider was the amount of concrete which could be filled in each day, technically known as the "lift." That varied, of course, according to the thickness of concrete and the amount of reinforcement, &c. It was inevitable that a slight change of texture and colour should happen at each "lift," and it was desirable from every point of view that the "lifts" should be kept as horizontal and regular as possible.



Timber shuttering was bound to move slightly in filling, if only from the natural swelling of the timber when soaked with water. Therefore, some method should be forthcoming which would allow for that change without detriment to the design. Shuttering of a section like weather boarding might meet some cases, so that if it moved outwards slightly it would be unnoticed.

R.I.B.A. Annual Dinner.

The annual dinner of the Royal Institute of British Architects will take place on Tuesday, May 6. Full particulars will be issued at an early date.

THE SPIRIT OF CONQUEST

In his lecture on Roman Architecture recently at the Central School of Arts and Crafts, Sir Banister Fletcher described the triumphal arches of the Romans as the outcome of Roman love of ostentation and a desire to impress conquered peoples with the military power of the empire. Thus amphitheatres for amusement, thermæ for luxury, and triumphal arches for show, depicted the various sides of human weakness which were catered for by those in power. These arches were erected in various parts of the home country, and in conquered provinces, to celebrate the opening of a new road or seaport of a new province. They produced in a permanent form in stone the arches, garlanded in evergreens, under which victorious generals passed in their quadrigas into a captured town, and all the details of the processions along the Via Sacra at Rome, when the returning victors went up to offer sacrificial thanksgivings in the Temple of Jupiter on the Capitoline Hill. The Arch of Titus recorded the capture of Jerusalem, and the bas-reliefs set forth the seizure of the Golden Candlestick and the table of showbread from the Holy of Holies in the Temple. The triumphs of peace were recorded in such arches as that at Beneventum.

Australia's Shrine of Remembrance.

Messrs. P. B. Hudson & J. H. Wardrop, Architects.

[This memorial is to be erected in Melbourne at a cost of £250,000.]

THE SURVEYORS' INSTITUTION

On March 10, Mr. J. Calvert Spensley lectured before this Institution on the subject of "Economic Effects of the Housing Subsidy and the Rent Restriction Acts." In the course of his lecture he dealt with the following points:—

House Shortage.

It was hardly necessary to discuss at any length the circumstances which had led to the shortage of dwelling-houses, but it was well to bear in mind the chief causes. In normal times periods of building activity had alternated with periods of building depression, the movement being followed by a converse movement of empty properties. In Greater London the volume of new building, which was high in the period 1898 to 1909, reached a maximum of over 27,000 in a year; it had already fallen to 13,000 when the land value duties legislation was introduced in 1909 and 1910. How far that measure directly or indirectly hastened the fall, and how far the fall was the natural consequence of a high proportion of empty properties, it was not necessary to discuss, but in 1912, 1913, and 1914, the yearly output was only 8,000. Whether with the decrease in empty houses the normal reaction would have begun to take place in 1914 could not be told, because the war involved the virtual cessation of house building.

Various estimates had been made of the true shortage—estimates which naturally varied according to the assumed requirements. In January, 1918, the lecturer put the number of new houses required for Greater London in the four years to April, 1921, at 53,500, namely, 36,000 working-class tenements and 17,500 non-working-class houses (300,000 rooms). Compared with this figure, the largest number of new houses built in Greater London was about 27,000 in 1899 and again in 1901. Thus, although the prospect at that time was serious owing to the limited building, it was not alarming, the estimated requirements being equal to only one-half of the number of houses built in the four years during the period of maximum production (105,000 in the four years 1899 to 1902). It was now known that the actual number of houses erected in the four years 1916-20 was less than 3,000, the numbers in 1921 being 10,000 and in 1922 18,000. As regards the present-day shortage, no definite figure had been stated officially, but in order to have some idea of the magnitude of the problem it might perhaps be said that 50,000 new houses and tenements would meet the immediate needs of Greater London apart from the slum clearance requirements.

Building Costs.

The second important factor in the consideration of the question was the abnormally high cost of building. There was, he believed, no authoritative statement showing the variation in cost for any long series of years. A contemporary (Ministry of Health figures) report showed the average approved tender prices in the months mentioned for two of the standard post-war type of houses as set out in the following table:—

A-Type (4 Rooms).

	1919	1920	1921	1922	1923
	£	£	£	£	£
January	—	782	834	494	346
February	—	798	824	494	367
March	—	817	700	436	364
April	—	817	697	395	355
May	—	855	697	392	368
June	643	860	693	382	341
July	713	870	665	378	365
August	757	875	612	370	351
September	800	881	594	349	352
October	750	888	573	346	358
November	735	859	577	332	387
December	744	841	514	346	410

B-Type (5 Rooms).

January	—	856	932	560	373
February	—	932	878	518	373
March	—	919	838	513	406
April	—	914	798	446	390
May	—	953	813	422	371
June	785	972	792	419	410
July	833	955	752	413	412
August	852	956	707	407	405
September	868	949	659	398	388
October	834	958	667	407	416
November	822	960	661	387	435
December	837	943	566	387	465

The A-type houses in general comprised living-room, scullery, bathroom, and three bedrooms,

No. 123, Wigmore-street, W. Messrs. Bennett & Hossack, F. and A.R.I.B.A., Architects.

[This building was formerly a private residence, and the old doorway and door have been retained. The shop front has been designed to harmonise with this door and to present the appearance of an eighteenth-century shop, while giving the maximum lighting area and a substantial display of fabrics, Chinese wall-papers, and antiques, which are associated with the name of Messrs. Green & Abbott, Ltd.]

and the figures included the cost of drains, paths, fences, &c., but not land, roads, or sewers. The B-type houses had in addition a parlour. The corresponding price of a pre-war house built to a type-B specification did not appear to have been calculated officially. Comparison between the cost of pre-war and post-war cottages might be made in the case of the London County Council's 1914 and 1919 cottages on Old Oak Estate, and the 1922–23 cottages at Roehampton, as set out below. Unfortunately figures relating to the 1924 cottages for Downham were not yet available. The post-war cottages mentioned were the simplest post-war types, but they possessed amenities which the pre-war cottages lacked, and a reservation was necessary in comparing the figures :—

	3 Rooms.	4 Rooms.	5 Rooms.
Buildings Only.			
	£	£	£
1914 (Old Oak)	220 ..	269 ..	317
1919 (Old Oak)	620 ..	784 ..	895
1921 (estimated)	774 ..	980 ..	1,119
1922 (Roehampton)	360 ..	406 ..	—
All-in Cost.			
1914 (Old Oak)	271 ..	338 ..	401
1919 (Old Oak)	712 ..	837 ..	1,032
1921 (estimated)	890 ..	1,071 ..	1,290
1922 (Roehampton)	— ..	— ..	—

With the greater demand for cheap building it was remarkable that, in spite of the impetus given by war to inventiveness generally, house building had been left with no satisfactory substitute for the hand-laid brick. While it might be admitted that centuries of building had evolved a standard brick perfect in shape, size and weight, it was, after all, designed for hand labour, and machinery and mass production had as yet hardly touched the problem of the provision of dwelling-houses. Herein the economic principle of "substitution" seemed to have failed in practical results.

The Bearing of House Shortage and Building Costs on Rents.

The relative bearing of house shortage and building costs upon the question of rents was fairly well recognised, and it was almost unnecessary to say that increases or decreases in the rent standard were not necessarily caused by increased or decreased cost of building, but that an important factor was excess or deficiency of demand in relation to supply. Thus, if after the war families had decreased in number or in size, or if, owing to a decline in trade or for any other reason, there had been a falling off in population resulting in a large number of empty houses, it was obvious that there would have been no great increase in rents, even though the cost of building were twice or three times the pre-war cost.

Building costs were, however, very important in relation to rent, because, with a great demand for houses, the economic tendency was that there would not be a supply to meet the demand unless a price was forthcoming (or a periodical payment by way of rent) which would recoup the builders for the expense of production. As wages and the prices of building materials were still high, the cost for which houses could be supplied was also still relatively high, and builders would not build except for intending purchasers, who, in relation to the rent-paying portion of the community, were comparatively few. Houses were not built for letting because the economic rent at which such houses could be let, though greater than the rents of the existing houses protected by the Rents Acts, would not be high enough to be remunerative.

In normal times the cost of building had an important bearing on rents in the direction of checking excessive rents, because rents could not for long exceed the equivalent annual cost of building a house. In other words, economic rents could not for long remain higher than remunerative rents, since, if excessive rents were charged, capital (which was fluid) would flow into the building industry and demand and supply would tend to bring about the normal. The normal at different periods would not be the same, *e.g.*, pre-war and post-war; but once normal conditions were established, one got what had been described as something comparable to the sea with its differences in level, sometimes small, sometimes great, as those caused, for instance, by storms and strikes, but always with a tendency to an average level. At the present time, however, normal had not yet been reached, and the cost of building as a factor in checking excessive rents was virtually out of action.

It might be well to make clear the meaning in which the term "remunerative rent" was here used in relation to "economic rent." The latter term denoted the rent which would be obtainable if there were free competition. Remunerative rent was the annual sum which, after meeting annual outgoings, gave a fair return on the capital sum invested. At the present time, remunerative rent was falling towards the level of economic rent. Normally economic rent and remunerative rent tended to coincide.

What had happened not only in London but throughout practically the whole country was that the demand for house accommodation had exceeded the supply, the demand being greatly affected by increases, both in the number of families and in the proportion of adults in the population, while the supply of houses had been greatly affected by the abnormal increase in the cost of building. Such conditions lead inevitably to the position where rents could be increased out of all proportion to the deficiency of houses.

The increase in the actual and potential economic rent of the smaller properties was also due to the fact that persons had had to reduce their standard of living and go into houses smaller than those they occupied before; this had necessarily increased the pressure on the smaller houses.

The Future.

The practical question had entered a new phase with the resumption of private enterprise activity and the possibility of dilution of the building trade. If the result was a rapid increase in the pace of house building, especially if this were accompanied by a decline in the cost per house, it ought to retard the extreme increase in the potential rent standard; that was to say, it might by recognised economic means produce the end which the system of rent restrictions was intended to serve, and at the same time avoid the anomalies which statutory interference with freedom of contract almost inevitably involved. Whether it could possibly produce the result in time to avoid the extension of statutory rent restrictions after 1925 was another question.

Already the check on building (whether caused by high cost of materials or by shortage of skilled labour) had had a very serious effect on the rent-paying community. If in spite of subsidies it were not possible to produce houses sufficient in number to show a margin of supply over demand by June, 1925, what would happen? The answer which the economist would give would probably be that, judging from the known factors, there would be an immediate increase of rents, since the legislature virtually allowed an open market in house rents, the only limitation being the county court judge's view of what was "harsh," "oppressive" or "causing exceptional hardship." The answer which the politician would give was probably influenced by the fact that the great bulk of the electors were protected rent-paying tenants and their wives, and that no party could face an electorate from whom protection was withdrawn before a margin of housing accommodation had been secured.

While, therefore, it was no doubt true that anything that interfered with the free play of economic forces was to be deprecated unless the safety or general advantage of the community at large should demand it, there would seem to be a social and certainly a political necessity for a continuance of rent restriction in some form until the housing shortage was remedied. Conversely it might be said that unless the shortage was well on the way to being made good within a very limited time, there would inevitably be a demand for an extension of rent restriction on lines which might have far-reaching political results.

The conclusion must be that we were too close to the practical working of housing subsidies and rent restrictions to judge of their economic results, and that the subject was not so much a part of economics as of politics, and that, for the time being, economic forces were subordinated to political and sociological forces.

TOWN PLANNING CONFERENCE AND EXHIBITION

Town planning, which is so intimately associated with housing, the reconstruction of unhealthy areas, the better building of the suburbs, the garden city movement, and the establishment of satellite towns, is to-day regarded as offering the only true solution to the social evils of our time. And, whilst town planning rests for its success on an appreciation of all the interests of the citizen, and in doing so becomes a stupendous undertaking, at the same time in its actual realisation it is certainly a very highly technical art. As such it is closely associated with architecture and engineering, and, as is recognised in regard to these two subjects, the necessary qualifications to practise town planning can only be obtained through organised education. The Universities of Liverpool and London have had sufficient experience to justify their having established Chairs in this subject some fifteen and ten years ago. The Department of Town Planning in the University of London was founded in 1914. This year marks the tenth anniversary and during the ten years of its working many of our most promising town planners have emanated from the School. This year it has been decided to hold at University College, Gower-street, from March 31 to April 5, a Conference and Exhibition.

The exhibition is to consist of the work of past and present students and of proposals and incidents of particular interest in the neighbourhood of London. The conference, to which all members and officials of local authorities are especially invited, is meant to help in the technical difficulties of statutory town planning.

The following programme has been arranged :

The opening ceremony will be performed on March 31 by Prince Arthur of Connaught.

Tuesday, April 1, *at* 5.30.—Address by Dr. Raymond Unwin—"Zoning requirements of Town Planning Schemes under the Act." Chairman—Mr. Alfred Gotch, President of the Royal Institute of British Architects.

Wednesday, April 2, *at* 5.30.—Address by Mr. George Pepler—"The Technique of preparing Maps in connection with Town Planning Schemes." Chairman—Mr. Thomas Mawson, President of the Town Planning Institute.

Thursday, April 3, *at* 5.30.—Address by Dr. Gibbon—"Town Planning Schemes in their relation to Regional Development." Chairman—Mr. Neville Chamberlain.

Friday, April 4, *at* 5.30.—Address by Mr. Topham Forrest—"Architectural interests involved in the making of Town Planning Schemes." Chairman—Mr. Andrew Taylor.

Incorporation of Architects in Scotland.

A Council meeting of the Incorporation of Architects in Scotland was held recently at Edinburgh. The chair was occupied by Mr. T. P. Marwick, F.R.I.B.A., President. A letter was read from the Royal Institute of British Architects, in which agreement was expressed with the suggestion of the Council that a medal be awarded by them quinquennially for the best street frontage in the large towns of Scotland, and he expressed the hope that the scheme would prove a successful innovation. A bust of the late Mr. William Burn, architect, Edinburgh, was presented by his grand-nephew, Mr. H. L. Anderson, architect, London. There were elected two Fellows, one Associate, and five Students.

ARCHITECTS' AND BUILDERS' INQUIRY BUREAU.

*** *We are glad to give questions and answers but cannot accept responsibility for contributed replies, especially on legal matters.*

Cost of Building.

SIR,—Can you kindly direct me what would be a fair price per ft. cube upon which to base an approximate estimate for a small house in an urban district in the home counties? The work to be of the plainest and simplest description, but sound and good. Personally, I thought 1s. per ft., but it would be interesting to me, and no doubt to others, to hear what other experience would dictate.

ARCHITECT.

Road Charges.

SIR,—Can any of your readers advise me how much the road and sewer charges are likely to amount to per ft. frontage on a site adjoining a 24 ft. roadway not yet made up or sewered on a building estate in the Midlands? The road is not a main thoroughfare. Is there any redress in cases where the road charges are thought to be excessive?

INEXPERIENCED.

Strengthening Columns.

SIR,—I should be very grateful for advice as to the best and most inexpensive method of strengthening cast-iron columns of the hollow circular type, to render them capable of bearing more than their designed load. It is not possible to attain access for grouting the centre up solid in cement, and possibly even this would not go far towards solving the problem.

CONSTANT READER.

Asphalting.

SIR,—We have two houses in Earl's Court with roofs of zinc sheeting which has become porous, and we are desirous of repairing same at as low cost as possible. An asphalte firm has quoted us the price as £90 for asphalting the two roofs, and we also have a quotation for re-zincing at £60. Both these are too high, and we should like an opinion as to how it could be done at much lower cost and at the same time be made lasting.

F. DAY.

London.

Inigo Jones: Drawings by Sir Charles Barry.

SIR,—I shall be greatly obliged if you could inform me, either direct, or through your correspondence column:—

(1) The name of the sculptor of the marble bust of the late Inigo Jones, and where the bust can be seen. I believe it is in one of the Architectural Institutions. The reason for this is that I have the original plaster cast from which the bust was made.

(2) Whether you can inform me if there is a market for the sale of a set of original working drawings, some signed by the late Sir Charles Barry, dated 1847–50, used in connection with some of the contracts of "The New Palace of Westminster" (now the Houses of Parliament). The reason for this request is that I have to dispose of same to the best advantage in winding up an estate, and fourteen of these drawings are in my possession.

The favour of your best advice in these matters will greatly assist me.

A. G. CHESHIRE.

[REPLY.]

The terra-cotta bust of Inigo Jones at the Royal Institute of British Architects is probably the one of which our correspondent has a plaster cast. In the Victoria and Albert Museum, South Kensington, is a lime-wood carved medallion of the architect, but we know of no marble bust of him such as our correspondent expects to find. The monument erected in 1652 over Inigo Jones' grave in the Church of St. Benet in the City was destroyed by the Great Fire, and if any remnants remained Sir Christopher Wren did not reinstate them when he rebuilt this church (now seen in Queen Victoria-street) in 1680. The Royal Institute of British Architects possesses a brown line portrait sketch made by Inigo Jones of himself, and in the Court-room of the Barber Surgeons' "Hall" in Monkwell-street, E.C., Vandyck's well-known oil painting of Inigo Jones is treasured. Another belongs to Lord Darnley by the same painter, and copies of that portrait are not uncommon. Another is at Charlton House. Hollar, in 1655, engraved Vandyck's sketch "En grisaille" of Inigo Jones, and W. Hall's fine frontispiece to Cunningham Graham's "Inigo Jones" is one of the best known. A fine engraving of him by R. V. Vorst, after Vandyck, furnishes a capital folio plate in Triggs and Tanner's "Some Architectural Works by Inigo Jones."

Drawings by Sir Charles Barry.

The probable money value of fourteen sheets of the original working drawings of the New Palace of Westminster, dated 1847–50, must depend upon their condition and character. Our correspondent says that some are signed by Sir Charles Barry, and "used in connection with some of the contracts," consequently it would appear that they are ordinary utilitarian plans of portions of the structure, and not likely to be of permanent interest or architectural value. Complete plans and elevations of the Houses of Parliament as executed and signed by either Sir Charles Barry or Pugin would possibly possess a competitive value if offered at auction, simply as historic records of a national building of world-wide fame.

Contracts.

SIR,—The abnormal condition of the labour market at the present time makes it extremely difficult for surveyors to give estimates or adjust builders' accounts; and having business with various builders, I am faced with the question of allowances for decrease in rates of wages which is universally required in contracts. Allowance having been made in large contracts for the decrease which started February 1, 1923, I find for some weeks past that builders have been compelled to pay workmen 2d. to 4d. per hour in addition to the trade union rate; whilst, on the other hand, Government contracts stipulate that the contractors shall pay the union rate and no more. When this increase is demanded as a set-off to any decreases, it is disallowed, because the contractors take the risk. Has the contractor any legal claim to be allowed these increases owing to shortage of skilled labour, and over which he has no control?

H. W. IDLE.

[REPLY.]

This is a question of contract. Where, in an entire or lump sum contract, it is provided that an allowance be made for any decrease in the rates of wages during the period of the contract, it would appear clear that that allowance must be made. It is, therefore, not possible to set off against such decrease any additional rates paid per hour by the contractor over and beyond the trade union rates. The fact that the contractor has been compelled to pay additional rates, owing to lack of skilled labour, to workmen he has employed, was a risk the contractor had to provide for in his tender, together with other similar contingencies. He has no legal claim to be repaid any amounts so paid, for by his own contract he created a duty for himself, and he is bound, subject only to exceptions contained therein, to fulfil it. Quite apart from what we believe is the legal position, there may be, however, a strong moral claim.

Architecture Club Exhibition.

Burford Priory: New Wing and Terraces. MESSRS. WRATTEN & GODFREY, Architects.

ROBERT ADAM

At a recent meeting of the Manchester Arundel Society, Mr. John Swarbrick, F.R.I.B.A., gave an address on "Robert Adam." After some reference to Robert Adam's earlier years, he said in 1754, when in his twenty-sixth year, he travelled upon the Continent in order to study architecture. He passed through France to Italy and Rome, but returned early in 1758, down the Rhine from Venice and Switzerland, for England and France were then at war. This journey exercised a most remarkable influence over his subsequent work. Whilst abroad he met Charles Louis Clérisseau, Piranesi and many other distinguished artists, but, probably most important of all, he discovered that the architecture of the Romans was not in reality the stiff, inflexible affair of rigid rules that Palladio and his successors had represented it to be. Robert Adam was also an antiquary, and his natural predilections led him to explore the ancient remains of Roman buildings, such as the vast baths, the ruined palaces, the subterranean vaults or grottos, and such places as Herculaneum and Pompeii. Moreover, in 1757, he equipped an expedition to Spalato, in Dalmatia, and had those splendid engravings made that were subsequently published in his great work on this subject. Possibly this undertaking did much to establish his early reputation.

In 1761 he was appointed "Joint Architects of His Majesty's Works." Popular as Robert Adam undoubtedly was, it needed all his endurance to bear with equanimity the persistent prejudice against Scotsmen which then existed. Yet no architect of the day was more generally popular. He became the fashionable architect, and among his clients were the King and Queen and many members of the peerage. Commissions came to him from all parts of the United Kingdom and Ireland, and so great was the demand upon his services that it was with difficulty that he sought to fulfil his engagements with satisfaction to his clients and credit to himself. So anxious were some of the eighteenth-century house builders to secure the advice of Robert Adam that they dispensed with the services of older architects.

Almost as soon as he began to practise he started to prepare designs for furniture and the various appointments of private houses and other buildings, as at Harewood House (Yorkshire), Syon House, Osterley House, Kedleston, and Nostell Priory. He realised that an interior could not be pleasing so long as the furniture and fittings bore no relation to the architectural treatment. He perceived that there must be consonance throughout, and that if the work were to attain to true excellence one scheme of effect must govern the treatment as a whole, and that the carpets, ceilings, walls and fittings, together with the smallest pieces of furniture and sundry features, must all be designed in accordance with the general scheme. The variety of subjects that it became necessary to design, in order to apply this principle, was very considerable. Not only did he find it desirable to design cabinets, upholstery, carpets, tapestry, and embroidery, but also mirrors, silver plate, memorials, freedom caskets, lead fanlights, fire-grates, door furniture, girandoles, épergnes, torchères and many other details too numerous to mention. Though many of these designs were open to criticism, there was in most an artistic expression that still retained a living charm.

In 1760, two years after Robert Adam's return to England, his younger brother, James, started upon the Italian tour, from which he did not return until May, 1763. Whilst abroad, James purchased, on behalf of George III, the large collection of drawings and prints which then belonged to Cardinal Alexandro Albani. He also employed Clérisseau, Zucchi and other artists to prepare drawings of architectural and decorative work for professional purposes. Engravings of some of these drawings by Cunego were subsequently published. In this and other ways, Robert Adam came into the possession of a fine collection of drawings, paintings, engravings, books and ancient marbles. He was, in fact, a collector and connoisseur of great discrimination.

We in this country were apt to regard the Adam style as the artistic expression of Robert Adam alone, but though Adam undoubtedly impressed upon his work the stamp of his own individuality, it should not be forgotten that his treatments were due not solely to his personal investigations of ancient Roman remains and observation of Cinquecento work in Italy, but also in a large measure to that second eighteenth-century renaissance or revival of the study of the antique aroused by the writings of the Abbé Winckelmann and others. It was this same movement that influenced the work of the Louis XVI period in France. Probably Adam learned much from the French in the design and arrangement of stately interiors. The manner in which he arranged rooms *en suite* and secured vistas and also varied the shapes of the rooms, introducing round and oval apartments and exhedræ, was distinctly clever. Another service of Robert Adam to art, which was too often overlooked, was the raising of public taste from an admiration of Chippendale's Rococo and Chinese treatments, and other contemporary vagaries, to an appreciation of the excellencies of the lighter and less familiar work of the ancient Roman craftsman. Adam's judgment in such matters as town planning and the design of public bridges, such as those at Edinburgh and Bath, was excellent in many ways, and much in advance of that of most of his contemporaries. The most familiar architectural works of Robert Adam are probably the Register House and University at Edinburgh, Harewood House (Yorkshire), Kedleston, the interior of Croome Court, Stowe, Lansdowne House, Osterley, the Adelphi, Mellerstain, the Countess of Home's house in Portman-square, Gosford House, Nostell Priory, Kenwood, the Watkin Wynne house in St. James's-square, and Syon House. As the interiors of most Adam houses were not shown, the public had become accustomed to judge the merits of his work by the standards set by such replicas as they might have seen. Some of these did not do justice to Adam. He had even seen the light, gossamer-like bas-reliefs picked out in bright colours on a tinted ground, in a perfectly shocking manner. At Mellerstain some of the original Adam work had been painted by modern decorators chocolate and other colours, with an appalling effect. Many architects had been shocked to find that it has become the custom for certain well-known firms of furnishers to set immature draughtsmen to copy portions of some of the original designs of the brothers and then adapt them to suit entirely different apartments. The result had often been a meaningless, uninspired hotch-potch of Adamesque detail that no discerning connoisseur could well respect and this kind of stuff had often been called contemptuously, "the Adam style." Professor Sir Reginald Blomfield wrote in his "History of Renaissance Architecture in England":—"Their [the Adam brothers] work is often graceful and accomplished, refined in proportions, and dexterous in ornament, but it is feminine in quality and steeped in affectation. One looks in vain in their work for the energy of intelligence, the strong contempt for prettiness, which even the inferior masters of the older school possessed in some degree. The elegance of the Adams was but a poor substitute for this great quality. Their art was essentially a morbid development, evidence of the slow decay that was surely overtaking the once magnificent school of English architecture." After reading that one began to wonder if Sir Reginald Blomfield had forgotten the simple, broad effect, severity, dignity and massiveness of Adam's design for the main front of the Edinburgh University and other similar work. There was certainly nothing there that could be called either feminine or affected—the treatment was bold and masculine to a degree. It showed, in fact, that simplicity of treatment which characterised Adam's work after the disastrous American war, which ended in the declaration of Independence. Robert Adam struck a note that no other British architect or designer had struck before him, and on general grounds he occupied a place of honour in the history of the development of English architecture. It could at least be said of him that he was the first English architect to show how the principle of unity of effect or consonance could be applied in order to bring both the accessories and appointments completely into accord with the architectural treatment. Too many architects had been content to provide the structure and leave the owner without any advice or guidance with regard to its equipment or setting. It must therefore be clear that Robert Adam was in some respects a pioneer and a man accustomed to take a broad and comprehensive view regarding his work as a whole. They must all admit that, if they wished to be fair, irrespective of whether they might entirely agree with the details of his treatments or not.

BOOK REVIEW

Little Things that Matter. For those who Build. By EDWIN GUNN, A.R.I.B.A. (London: Tothill-street.) Price 5s.

That strict attention to the details of construction is of the highest importance in house building is so obvious that the point would seem to require no emphasis. We know, however, from painful experience, that this is not the case. How often it is that an architect is called in by a distressed client to inspect a new house in which serious defects have developed, the cause of which is unknown; and how often it is that the result of the examination is the discovery of faults in construction which could easily have been avoided, but which will now require drastic and expensive remedies. Dry rot, perhaps, has developed, owing to defective ventilation beneath the floors, or due to the fact that the damp-proof course is in the wrong position. Damp walls and cracked ceilings are found to be the result of a want of attention to detail, which is either due to a lack of knowledge or to careless workmanship.

It is, therefore, with considerable pleasure that we have read the manual on "Little Things that Matter" before us, and can heartily recommend its use to all those engaged in cottage and small house construction, for whom it is primarily intended. In a succinct but lucid manner, the author discusses the various details of house construction, including foundations, damp-proof courses, hollow walls, weather-proofing, tile roof covering, the treatment of eaves, valleys, hips, ridges and verges, the position of chimneys and the treatment of doors and sash-frames; and he makes useful suggestions from his own experience as to the construction of these details in a satisfactory manner. As an instance of the small things that matter, the author refers to the position of taps over a pantry sink, and says that he was once informed by an hotel manager that he had saved 50 per cent. of his considerable bill for breakages of china and glass by removing the hot and cold cocks to the corners of the wash-up sink. In this position, they are equally convenient for use, and they do not come so readily into collision with the articles being handled. The manual, in which æsthetic as well as constructive values are considered, is evidently the result of considerable practical experience; it is profusely illustrated by clearly drawn sketches, and the subjects are defined by marginal headings.

HOUSING PROBLEMS IN AMERICA. (New York: National Housing Association).

THE WEEK IN PARLIAMENT

WESTMINSTER, *Wednesday.*

Peabody Buildings.

Sir J. Remnant asked the Minister if he was aware that the tenants in the Peabody Buildings adjacent to the Windsor Hotel, Victoria-street, Westminster, were being turned out to allow the building to be converted into flats; and if he could postpone this conversion until the great demand for housing accommodation by the working classes in London had been relieved.

Mr. Wheatley said he was informed that these buildings were sold by the Peabody Trustees because they were regarded as out-of-date, and that they had now been vacant for some time. He understood that all the occupiers had been provided with alternative accommodation in dwellings belonging to the Trustees, including a new block of dwellings which was erected in Westminster in substitution for the Victoria-street building.

Answering further questions, Mr. Wheatley said that he would deprecate any interference with existing housing accommodation. His belief at the moment was that he had no power to stop the conversion of these working-class dwellings into more expensive flats. The appeal should have been made to another authority. It probably was made, and the authority might have been less sympathetic than he would have been had he had the necessary power.

Parlour and Non-Parlour Houses.

Mr. Wheatley informed Lord E. Percy that the average prices of non-parlour and parlour houses included in contracts let and reported by local authorities during the month of January, 1924, were £384 and £445 respectively. These prices were exclusive of the cost of land, roads and sewers. The corresponding averages for the three previous months were :—

	Non-Parlour.	Parlour.
October, 1923 ..	£358	£416
November, 1923..	387	435
December, 1923..	412	465

Labour and Prices.

Mr. Wheatley informed Mr. D. G. Somerville that he was in communication with the building industry as to the arrangements to be made in order to ensure the supply of labour and materials necessary for the carrying out of an adequate housing programme, but he was not yet in a position to make a statement. The question of price, which was, of course, a very important element in any housing scheme, was also receiving consideration.

The 1919 Act.

Mr. Wheatley informed Mr. P. Harris that the total number of houses erected by local authorities and public utility societies under the Housing, Town-Planning, &c., Act, 1919, up to February was 168,430, and a further 4,634 were under construction at that date, 39,184 homes were completed by private builders with the aid of the subsidy authorised by the Housing (Additional Powers) Act, 1919.

Concrete or Brick?

Mr. P. Harris asked the Minister whether he could say if the experiences of his department during the last four years had led him to the conclusion that in the erection of cottages concrete could be substituted for brick with advantages in economy and durability.

Mr. Wheatley said that cottages could be designed and constructed in concrete so as to be equally as durable as brick. The relative degrees of economy would depend on various local circumstances, but particularly on the availability and cost of bricks, suitable aggregate and skilled labour.

Ancient Monuments.

Sir M. Conway asked the Secretary to the Treasury, whether in providing work for the unemployed the opportunity would be taken to place funds at the disposal of the Ancient Monuments Commission for the excavation of ancient monuments in Great Britain.

Mr. W. Graham said that the function of the Ancient Monuments Commission was to make an inventory of Ancient and Historical Monuments and to specify those most worthy of preservation. It did not include the work of excavation. A considerable amount of work to relieve unemployment was being undertaken in connection with the ancient monuments supervised by the First Commissioner of Works.

The Rent Restrictions Bill.

Mr. Wheatley informed Mr. T. Thomson that Mr. Gardner's Rent Restrictions Bill was being examined in detail. If the Government decided to make any departure from the course already announced a statement would be made.

Building Trade Negotiations

Mr. Wheatley stated, in reply to questions, that the negotiations with the building trade were being expedited as much as possible, but he was unable at the moment to state when he should be able to make a statement on the subject.

Overcrowding in Finsbury.

In reply to Mr. Gillett, Mr. A. Greenwood said the Minister of Health was aware of the overcrowded housing position in Finsbury, but he thought that the situation there could probably best be relieved by increasing generally the accommodation available for the Metropolis. He understood that this Borough was rapidly losing its residential character and that there were no vacant sites of any size.

Production of Bricks.

Mr. Mills asked what was the present annual production of bricks; whether it exceeded 160 bricks per day; and, if not, would the Minister take steps to increase the output in the brick-making industry, in view of the building programme outlined by him.

Mr. A. Greenwood said that the question of the steps that could best be taken to secure the provision of sufficient supplies of material to ensure the carrying out of an adequate housing programme was one which the Minister had asked the building industry and the manufacturers of material to consider. The present output of bricks was variously estimated at between 2,500 million and 4,000 million a year.

Westminster Cathedral.

Mr. Henderson, the Home Secretary, informed Sir H. Brittain that the Westminster Cathedral Authorities intended to take precautions to make a fall from the parapet impossible, and he hoped their example would be followed by all authorities responsible for similar places to which the public had access.

Rings and Trusts.

In reply to a question as to whether he would set up a committee to inquire into and report on the operation of trusts, rings, and co-operative societies in this country, Mr. A. V. Alexander, Parliamentary Secretary to the Board of Trade, said that the suggestion would be considered, but several committees in recent years had inquired into the operation of trade combinations.

Office of Works Houses.

Lieut.-Commander Kenworthy asked the First Commissioner of Works if he would state what were the overhead charges incurred on the houses built by the Office of Works by direct labour under the Addison and other housing schemes, including architectural and contractional services, salaries of staff, and cost of office accommodation; and what was the percentage charge in the case of schemes supervised by the Office of Works and carried out under lump sum contracts, including salary charges, cost of office accommodation, &c.

Mr. Jowett said the percentage charge for overhead expenses on the housing schemes executed by H.M. Office of Works had worked out at 3 per cent. in respect of schemes carried out by direct labour and 2 per cent. in respect of schemes carried out by contract.

State-aided Houses.

Mr. Greenwood informed Mr. T. Thomson that the total number of State-subsidised houses completed in each year since 1919 was as follows: 1919, 100; 1920, 15,711; 1921, 86,669; 1922, 88,999; 1923, 19,185.

Mr. Wheatley, in reply to Mr. Lambert, said that up to February 1, 168,430 houses had been completed under the Housing, Town Planning, &c., Act, 1919. The average all-in cost for houses erected under the provisions of the Act would be approximately £1,040. It was anticipated that the annual loss falling on the Exchequer would be £7,700,000 per annum.

Scottish Schemes.

Mr. Adamson (Secretary for Scotland), informed Mr. D. Millar that the number of houses proposed to be erected under schemes put forward by Scottish local authorities under the Housing, Town-Planning, &c. (Scotland) Act, 1919, was 115,574; the total number sanctioned for erection by local authorities under that Act was 25,129; and of these 21,011 had been completed at January 21, 1924.

The New Rents Bill.

Stormy scenes were witnessed at the first meeting on Tuesday of the Standing Committee of the House of Commons which is considering the Rent Restrictions Bill of Mr. Gardner, the Labour member for the Upton Division of West Ham. Mr. Wheatley, Minister of Health, and Sir Patrick Hastings, Attorney-General, have withdrawn from the Committee. The Government are represented by Mr. Stewart, Under-Secretary of Health for Scotland. Mr. Mardy Jones, a Welsh Labour member, is in charge of the Bill.

The first amendment, moved by Sir Kingsley Wood, was to postpone Clause 1, which seeks to extend the date of decontrol. After a thirty-five minutes' speech from Sir Kingsley Wood, the Chairman ruled that the amendment was a dilatory motion, and he refused to accept it.

Lt.-Col. Fremantle moved an amendment providing that if decontrol did not come to an end by 1925, an extension of control should take place only on the advice of the local authority. He said that if private enterprise was to supply ninety per cent. of the houses, as in the past, decontrol at an early date was essential. The local authority knew where the shoe pinched.

The amendment was still under discussion when the Committee adjourned.

Business Architecture.

Manchester will shortly have a new shopping centre in the locality of King-street. This centre will be brought into being by the erection of commodious shops and offices on a site bounded on one side by Ridgefield, on another by South King-street, and on the third by Bow-street, and Ridgefield and South King-street are to be widened. In close proximity is the extension of Kendal Milne (Harrods). The architect for the Ridgefield and South King-street scheme is Mr. Charles Swain, of Manchester. A six-story building will be erected in Portland stone, and the whole scheme, it is estimated, will cost £80,000 to £100,000.

New Middlesex Road.

The contract for the construction of a new road starting at Finchley-road, Hampstead, and ending at the North Circular-road, Hendon, has been placed with Messrs. Walter Jones & Sons, Ltd., 64, Victoria-street, Westminster. The amount of the tender was £86,019.

The contract is the first to be placed in the Middlesex area in connection with an authorised scheme, involving a total estimated expenditure of £1,600,000.

THE BUILDING TRADE

QUANTITIES AND SMALL HOUSES

Recent correspondence and deliberations seem to indicate a certain amount of misgiving as to the purpose served by the issue of quantities for tenders upon small buildings, and notably as it effects the cost of houses of the size and class most in demand to-day. It is pointed out that the minute specification and measurement of the multitudinous little labours and details which singly have barely any money value at all, but which the builder for his own protection feels impelled to put a price upon, tends to raise appreciably the price of a tender above that which a builder would quote when tendering upon the merits of a job and without a prepared bill of quantities before him.

That there is indeed much to be said for this point of view, the open-minded onlooker can hardly fail to agree, but that it is right that it should be so is quite another matter, and one which raises the whole question of the relations between builder, building owner, architect, and surveyor.

The real purpose of a bill of quantities is not always clearly understood, and it is sometimes apt to be looked upon as merely a means of eliminating sharp practice on the part of contractors, who, as a class, often suffer in reputation for the offences of the very few. Russel Sturgis, in his "Dictionary of Architecture," gives a very sound definition of the purpose of a bill of quantities:—

"The purpose of a bill of quantities is to afford to a builder, in customary form, all the purely mechanical and clerical preliminaries for deducing from the drawings the value of the structure, to which may be added the further advantage (in usual regular practice), of this work being done only once for all the builders about to estimate in competition."

It will be seen, then, that its main purpose is one of service to the contractor, which purpose, no doubt, has its reflection in the prevailing but often criticised practice of making payment of the surveyor's fees through the contractor, though it gives food for wonder and thought that the revolt against the use of quantities for certain classes of work should come from the direction of the builders. A bill of quantities, of course, also serves the further purpose of forming a stable basis of contract which, once agreed upon by both parties thereto, is quite above and independent of personal judgment, that is, where the bill is properly framed. The extreme value of such an instrument is apparent to and recognised by all, except when applied to buildings under a certain limit of size, when doubts seem to arise.

A building of whatever size is a most complicated unit, involving many trades and many operations on the part of each. The intuition of the salesman who can appreciate at a glance the value he must place upon his goods to ensure a profit and competitive success, is hardly applicable to the builder, though it can perhaps come increasingly into play as the subject of tender decreases in size and complication.

Nobody wishes the builder to make either an excessive profit or a loss upon his work, and loose tendering may lead to the first in times of slack competition, or to the latter when the market is keen. The ideal at which any good man of business aims is a fair profit for a good sound job. Tendering upon a good bill of quantities brings such close tendering from contractors who know their job that it would seem to indicate that here is the medium through which this ideal may best be attained. We may, then perhaps, accept this as an acknowledged fact, while maintaining an open mind upon the interpretation which is by common usage placed upon this particular means to an end.

Let us examine, for example, a particular example applicable to the bill for any small house. The full orthodox way of billing a moulded frieze rail would be to give its lineal measurement, specify its size and describe, make a sketch of its moulding, number its mitres and its mitred returned ends, and so on. For a simple matter, it presents quite a formidable array of writing matter, and in spite of continual usage the contractor is apt to price out in a relatively formidable manner. He will bear in mind that he is bound by a clause that all quantities are measured nett, and that allowance is to be made for all cutting and waste, and for what may prove in actual work to be a very trivial matter, his small allowance per foot run may in the whole job total up to quite a considerable amount, particularly when his mitres and labours are added thereto from a round figure unit. All the time he has the confidence that his competitors are from force of custom placing a similar interpretation upon like matters, and that none of them will have the courage to leave blank items which may, in extra work, become relatively heavy when measured at schedule rates which would become nil.

A mould similar to the frieze mould might be required as an intricate ornamental panel over the fireplace, full of breaks and jumps and ears, and, if measured as a plain run of mould, might work out at a very low price for a very intricate little job. The estimator, therefore, feels called upon to protect himself by putting a price upon such labours, sometimes by the exigencies of currency units, quite out of proportion to their real value.

There is, no doubt, that an element of fear of the scope of a bill of quantities and of its binding nature has a damaging effect upon the expediency of its application. It is too often looked upon as a set of chains rather than as the real friend it can be to either party to the contract, and it therefore seems necessary that the form of such a bill should be made as simple and condensed as possible. A simple process should read simply and may then be priced simply.

There seem to be too many reiterated restrictions that by common usage go to swell the bulk of a specification and bill of quantities, with an apparent assumption that work by nature will be done badly when the natural assumption should be that it will be done efficiently, and while it is necessary to legally protect against the rogue, continual warnings against this, that, and the other thing are apt to take on a rather terrifying appearance.

For instance, when we all specify that all workmanship and materials are to be the best of their respective kinds and to the satisfaction of the architect, is it necessary to specify all timber to be well seasoned, free from loose or dead knots, &c., when anything short of these qualities would certainly not be "best"? Is it necessary to state that no cement must be beaten up again after it has once set, when such practice would certainly not be best workmanship? Is it even necessary to state that all stone is to be laid on its natural bed?

Of course, these items are specification items, but they find their way into most bills of quantities, particularly in the provinces, where a separate specification is unusual, and they make them bulky and tend to exaggerate an impression of the size and importance of a job, and the restrictions under which it is to be worked.

More particularly is this the case in smaller work. A little house that has two stone steps and a meat slab often carries a list of preliminary items to the stonemason's trade as verbose and important as those for a big stone-faced building.

It would seem, therefore, that there is much "dusting" to be done upon the surface of our custom-ridden documents before they can become the entirely useful instruments that they should undoubtedly be. Much of the vain repetition must go, to the relief of all parties. Only in the case of particular methods of practice peculiar to individual architects would there seem any need for very great elaboration to give security in law or practice.

We have touched upon the minute labours involved in the taking off of simple operations, and many of these might with advantage be taken as read without undue risk of a miscarriage of justice in the adjustment of variations, provided the builder, on examining the drawings prior to tendering, and, perhaps, with somewhat more care than is generally the case, knows his job well enough to see whether or not there is an unusual amount of such work to be anticipated. Cases will, no doubt, arise where extra work may involve an undue proportion of unmeasured labours, and where a strict following of the schedule would be unfair, but, surely, a reasonable architect and a reasonable builder between them could arrive at a fair ruling where a rigid following of the schedule prices would mean an obvious injustice. Cutting and waste might with advantage go in as a bulk percentage item following the items affected. There must be many such complications which with advantage might be "boiled down" to a handy and digestible bill, and a conference of architects and builders might do much good in evolving a simple standard model form of specification and quantities. We want to know just what form will approximate to the viewpoint of the builder who quotes on his own quantities, while giving adequate protection to all parties to the contract.

We have noted that the objection to all this minute detail is aimed at small work only, but it seems very probable that the same evils occur in the larger work also, for it must be a simple matter of proportion. They have been exposed in the smaller work because of the facility of comparison with similar tenders without quantities, so that it is obvious that such a conference as has been suggested could cover a very wide field of research and might lead to results of paramount importance.

There is nothing wrong with the ideal of good quantities as the basis of a contract, and there is no reason why they should not form an invaluable instrument of equity, and pay for themselves through the keener prices made possible by their discretion of detail.

It is, at any rate, a very serious thing that there should be the faintest suspicion that a bill of quantities is not only an individual extravagance but a breeder of other extravagances, when its whole purpose is one of service to all branches of building, to bring about the economies for which present-day needs call so strongly.

Craftsmen's Competitions.

Considerable interest is being taken in the Craftsmen's Competitions and the exhibition of work executed in the Building Craft Schools which are to be held in connection with the Building Trades Exhibition at Olympia, London, from April 11 to 26. In addition to the prizes in the Craftsmen's Competitions previously announced, the following City Companies have undertaken to award further prizes as under:—

(1) The Carpenters' Company, £10, and diplomas and medals; (2) Armourers' and Braziers' Company, £5; (3) The Painters' Company, Special prizes or diplomas to the value of 5 guineas.

Besides those from the London area, many applications have already been received from intending competitors from the provinces, and the competition promises to be keen, interesting and educative. Schools intending to exhibit work and students who wish to take part in the competitions should communicate at once with Mr. Don Cameron, Hon. Sec. to the Committee of Management, 43, Essex-street, Strand, London, W.C.2, from whom full particulars may be obtained.

THE TWO DEMANDS

Mr. John E. Yerbury writes :—

Sir,—Adverting to "Building Contractor's" example of working his method of payment by result, may I suggest that although it might be applied to the sub-letting of the labour, in brickwork as a whole, it would be difficult to apply in order that each individual in a gang should get his share? The contractor could enter into an arrangement with the piece-work bricklayer to give a bonus in this, or any other, way, but could the sub-contractor (for labour only) enter into a similar arrangement with the individual workers employed by him? Some men would work right through the job, others for a short time only, and it would be quite an effort in costing accountancy to satisfy every man employed; and the cost of checking the work would add considerably to the price.

Payment by result is easy when all men have to perform exactly the same operations and turn out a number of exactly similar articles; but it is very difficult to apply to the building industry with its many trades and various grades of work which each have. The overhead charges in a highly organised business are already a heavy handicap, and it seems to me that even if possible to work, "Building Contractor's" system would add considerably to these charges.

"Building Contractor" will, I fear, not obtain support for his proposal by giving examples of the easiest and simplest working of his scheme; but will have to deal with each and every trade, and in the most intricate cases to work in actual practice.

For the moment we will assume that he can set out a system which will work as easily in practice as his example works on paper; and both employer and worker will gain the advantage he shows.

Having agreed the value at £40 and having found that the actual cost was £30, the saving is shared as he suggests. When "Building Contractor" estimates the cost of the next similar job will he again agree the value at £40, knowing that the cost was £30? Will he not rather say: "This is a competitive job—if I estimate the value at £40 I shall lose it; let us agree the value at what we know the cost really is, £30. We shall then stand a chance of getting the job and make a living, which is better than losing it by trying to make an extra profit."

The men will naturally stand out for the previous figure, hoping again to receive a good bonus, and so "rate fixing" will be the future bone of contention in the building trade, as in some other industries.

I do not say it is impossible, but I can say that having discussed the subject for years, I have never seen a system which would work; and when I have put my own suggestions for profit-sharing to contractors they have always pointed out the very great difficulties to be overcome. The number of trades, the varying types of work, the differences in the proportions of labour engaged in the trades, the fact that those who start a contract may be all over the country before completion, and the impossibility of knowing whether a contract is profitable or not until very near the end. Ground work and brick work may be profitable. Can the contractor pay a bonus on these trades, and run the risk of loss in all the others?

If "Building Contractor" has a scheme which will work I hope he will be able to introduce it to those who rule the trade, and that it will receive consideration.

It may seem rather an impertinence on my part to criticise or to offer suggestions to those who are engaged in the industry, but my excuse is that I am concerned to see some progress towards those ideals which were the stock-in-trade of everyone during the war.

As I have written in your columns many times before the war, during the war, and since, "the interests of employer and worker are identical if they will but see it," and it is the strangest thing outside fiction that (in spite of the fact that every employer has succeeded who has seriously set to work to share profits with those who help to make them) the majority of employers are against the principle of profit-sharing in the sacred name of individualism.

I shall always regret the breaking-up of the Building Trade Parliament, from which I, at least, had hoped great things; and I am still sanguine enough to go on hoping that some day it may be revived. This, I know, is thought by some to be "arrant nonsense"; it may be to-day, but I still look for a saner view to-morrow.

I am convinced that the suggestion I made in your columns ten years ago could be turned to good account to-day, if only all employers were as are the most enlightened and all workers as are the most intelligent.

The more one studies the housing question the more one feels that things cannot go on as they are. Every industry should pay a sufficient wage to create contented workers (no man can be content to work for bare existence and the profit of others), for without contented workers this country never will give the best output per man in her industries.

The Interim Report of the Foster Committee laid the foundation upon which a working scheme might be raised, with good will on all sides. A round table conference might yet revive the Parliament and devise a working scheme which should be a light to lighten other industries.

APPRENTICESHIP IN THE LONDON BUILDING TRADE

A correspondent, Mr. H. W. Idle, writes as follows :—

Sir,—Referring to the letter in your issue of Feb. 29 from Mr. Ernest Lesser, my experience has been that an apprentice will learn his trade more thoroughly when machinery is absent; and this is usually the case in small firms that do not employ more than seven or eight joiners, or, say, forty in all trades, especially so in the provinces. How then is a builder in a small business to keep within the trade union regulation that there should be not more than one apprentice to seven workmen?

Again, Mr. Lesser's last word is "parents." To my mind the root of the apprenticeship difficulty is with them—an employer naturally asks a premium for teaching an apprentice, the first year being profitless. How many can afford £25 to £50 for premium, as well as the cost of tools?

In technical and evening classes there is a grant from the Government for each pupil who passes an examination. Why not hold out the same grant to employers, whose teaching is much more practical and thorough? There would be no financial difficulty with parents, and the employer would be compelled to take an interest in an apprentice with a grant from Government sources—also the completion of an apprenticeship is usually followed by constant employment in the same firm; small firms in particular.

"The Smaller House."

The work of many architects who are well known for the excellence of their domestic work, in addition to the work of younger men who are specialising in a similar class of work, is illustrated in "The Smaller House" (London: 29, Tothill-street, S.W.; price 25s. net). Some of the houses illustrated are pre-war, whilst the remaining examples are post-war. It is on the latter examples that interest will centre, and the problem of severe economy has been ably dealt with. The houses are shorn of most of their pre-war excrescences, perhaps to their advantage, and in many the bedrooms come in the roof, no doubt to economise brickwork, unavoidable but not always satisfactory; the types on Georgian lines are much preferable. Many interiors and garden lay-outs are illustrated. The volume concludes with a list giving the cost of some of the houses illustrated, when built, and their approximate cost to-day.

ARE LONDON BUILDERS PROFITEERS?

Mr. A. Bosworth writes :—

Sir,—May I venture to seek a little light on this subject through the medium of your columns, if you will be so kind as to spare me a little of your valuable space for this purpose?

Some few weeks ago, in the columns of *The Times*, the Chairman of the Leicester Housing and Town-Planning Committee declared as a fact that, from actual experience not theory, it had been found that "really spacious semi-detached houses could be built in bulk, with a fair margin to the contractor, for £350." I quite appreciate that what may be possible in Leicestershire may not necessarily be possible in London within the same limits, owing to higher rates of wages, but materials should not, I think, cost more here than there. Yet I find it impossible to get anything here within 20 per cent. of the Leicester figure (£350), even for flats in blocks of six or eight, much less really spacious semi-detached houses.

On the basis of the Leicester testimony, which scarcely admits of any doubt, my idea of a reasonable price for London is £450 for flats and £500 for houses, good class structures, decent interiors and pleasing exteriors, but it would seem these figures are impossible to the London builder. Hence my query as above. Perhaps some of your readers would care to express an opinion.

HOUSING AND EDUCATION.

A meeting convened by the National Union of Women Teachers (London Unit) was held at York Mansions Restaurant, S.W.1, on March 6. Mrs. Tidswell (President), in opening the meeting, said it had been called to discuss "The Relation of Housing to Education," as being teachers they knew the very detrimental effect bad and inconvenient housing conditions had on the children whom they were called upon to educate, and they felt how very difficult it was even to teach them cleanliness when there was only one water tap in a house tenanted by several families. In her opinion a great deal of the money spent on education was wasted on account of the bad housing.

Miss Titleboam (ex-President) said the question was very forcibly brought home to teachers when mothers of their pupils came with complaints about the insanitary state of their houses and asked for advice. She compared conditions of living in fine houses with those of the slums, and pointed out how easy it was for children born in the former to benefit by their educational advantages, while those who lived in overcrowded houses had little chance of retaining anything learned in school owing to the terrible surroundings in which they were forced to grow up. What chance had they? Fifty per cent. of those children were never even rested, because they had no rooms to rest in, and teachers spent half their school hours merely endeavouring to correct wrong impressions and remove from the minds of the children the ugliness gained by them during the time they were not at school.

Miss Lovell (Women's Housing Council, Kensington) believed the only remedy for such conditions was to educate public opinion and then bring influence to bear on the Government.

Miss Biggs (Secretary, W.H.C., Westminster) said there were 3,000 people in Westminster living in two rooms, with families ranging from three to eleven in number, and although many of the buildings were camouflaged with beautiful exteriors the interiors were not fit for human occupation. Under the Acts of 1890 and 1909 tenants could demand that repairs should be done, but their powers were greatly modified by the fact that if they were turned out there were no other houses for them to inhabit.

BATH BUILDERS' ASSOCIATION

The Bath Master Builders' Association held their annual dinner recently. Mr. George Hayward (president of the Association) presided, and was supported by, among others, the Mayor of Bath (Mr. Charles H. Hacker), Messrs. H. Matthews (president of the National Federation of Builders), P. Bovey (president of the S.W. Federation), W. S. Weeks (president of the Bristol Association), F. N. Cowlin, E. W. Wooster, J. Basil Ogden, H. H. Morgan, A. J. Taylor, A. C. Fare, T. B. Silcock, G. E. Peto, J. Pictor, W. A. Williams, T. A. Pearce, E. Ireland (vice-president), G. E. Hiskens (hon. secretary), etc.

Mr. E. Ireland, proposing "The Mayor and City Council of the Queen City of the West," said the problems of civic government were to-day greater than they ever were before.

After the Mayor had responded, Alderman C. H. Long, proposing "The National and South-Western Federations of the Building Trades' Employers," said the question of housing had been a great trouble to many Governments. The present Government, unlike other Governments, had gone to the National Builders and the National Operatives and asked them to form a joint committee, which was sitting to-day, and at which Mr. W. H. Nicholls (past president of the National Federation) was the chairman.

Mr. H. Matthews (president of the National Federation), in responding, said that he felt they were not attaching the importance to the question of apprenticeship that they ought. They were told by the operatives that they ought to have 56,000 apprentices engaged in the building industry, and yet there were only 21,000, leaving 35,000 minus. He did not think that was a creditable thing for the industry, and it would seem that somebody was lacking in his duty. The Federation had tried on three or four occasions to get employers to make a return of the number of apprentices and skilled workmen they employed, and they had failed on every occasion. Was there any reason why they should not give those returns and so enable the Federation to attack that great problem where it needed attacking most? Supposing that 35,000 more apprentices had been engaged in the industry, say since the Armistice, how much better off they would be for skilled labour to-day than they were.

Dealing with the housing question, Mr. Matthews said he believed that the present Government were in earnest on that matter and were going to leave no stone unturned in order to redeem promises which they had made. They way in which they approached the question was so different from the way previous Governments had approached it, that he thought they would not only make a great success but also deserve it.

The Chairman, responding to the Mayor, said if Bath was to vie with the other spas of England and the Continent there was no doubt about it that a winter garden was a necessity. It would be said that they had not got a site. Well, he had found a site. To his mind it should be in the north side of the North Parade Bridge. In spanning the river they would span it sufficiently wide to build a winter garden on the city level.

The remaining toasts were "Architects, Engineers, and Surveyors," proposed by Alderman A. W. Wills, and acknowledged by Mr. A. J. Taylor; and "Our Guests," which was submitted by Mr. F. J. Blackmore and responded to by Messrs. W. S. Weeks and Frank N. Cowlin.

Change of Address.

On and after March 24 the address of the Val de Travers Asphalte Paving Co., Ltd., will be 106, Salisbury House, Finsbury Circus, E.C.2.

PAINTERS' AND DECORATORS' MATERIALS

On February 29, Mr. Charles H. Eaton, F.I.B.D., gave a lecture on this subject before the students of the Architectural Association, Bedford-square. Mr. J. Cayley presided.

In the course of his remarks Mr. Eaton said the work of the painter and decorator was quite the most important of all the building trades. They might recall that when relics of antiquarian interest were discovered, very frequently the greater part of the interest was in the paint.

A general rule in painting was that all surfaces must be clean, smooth and free from dust, grease or dirt of any kind, and must be perfectly dry. Labour, probably the most expensive item on the works, should be the most highly skilled for the type of work involved; expenses were generally higher, ultimately, if a low grade of labour was employed. The materials used should be always of the best, obtained from a firm whose reputation was beyond all doubt. This insistence upon the best possible material was so important that it might be said if they failed to satisfy it, they were guilty of gross negligence; failure to use the best material would very materially increase their labour cost in the additional effort required on the part of the craftsman in his efforts to turn out a good job.

The lecturer then dealt with special problems and said three factors were necessary before rust set in, viz., the presence of moisture, oxygen and carbon dioxide gas. Impurities in the metal itself were a contributory cause. There was some difference of opinion as to the removal of scale prior to painting. He was convinced that iron work should be well brushed with a wire brush, or sand blasted, and painted at the works whilst still warm. Undoubtedly red lead or iron oxide paint was the best for the purpose. It was cheap and efficient, covered remarkably well, and was of a pleasing colour.

Dealing with the question of rubbing down, the lecturer said for generations—in fact, since the introduction of oil paints—considerable trouble had been experienced with the dust-creating glass-paper used for rubbing down the surface of paint to make it smoother. Things had altered and they now had waterproof glass, or flint papers, being used in place of ordinary paper, from which particles of flint became detached. By the new method the surface was merely sponged over and the waterproof glass-paper applied. It cut rapidly, reduced rubbing-down costs, avoided dust, and was much healthier for all concerned, in addition to which it gave a much better finish to the work.

The treatment of surfaces upon which distemper had been applied was not very difficult if the work had been properly done. It would be easy to wash off the old distemper which normally was soluble in water. The first application of paint followed as soon as the wall surface was dry. The time appeared to have passed when craftsmen prepared their own flat paint, or flatting, and they now had offered a wonderful range of flat enamels made in practically any colour. They were capable of standing reasonable washing, a quality not found in the older type of material. He would draw their attention to reds; at one time it was difficult to find a red that would keep its colour; after a few months it became a definite pink of unattractive appearance. They now had reds that were so permanent in colour that the trouble was to get rid of them when they wished to change their colour scheme. However, a material had been produced which effectually sealed them. Liquid sealer was a material which prevented any preceding material from bleeding through any subsequent coats of paint.

The painting of new plaster was not to be recommended; if moisture were imprisoned, it would lift the paint film, and so the paint would fall off leaving defects in the surface that increased the cost of later work. Keen's and Parian cement required to be painted immediately they were set from the trowel; then a period of some weeks must elapse before further treatment.

Generally it might be inferred that if work did not turn out satisfactorily something was wrong with the method of preparation. At all times manufacturers were ready and willing to place at the service of their clients a paint technologist who would assist them to get to the bottom of any trouble, but faults were generally caused by lack of skill and interest.

A discussion followed the close of the lecture, and Mr. L. H. Bucknill, A.R.I.B.A., thanked Mr. Eaton for his paper and said the explanations given would enable them to understand many things that previously had been obscure.

NEW BUILDINGS IN LONDON.

Portugal-street.—Extension.—An extension is now being made to the London School of Economics, Portugal-street, Kingsway. It will have a Portland stone front, which is being executed by the builders, Messrs. F. G. Minter, of Putney. Messrs. Lindsay's Paddington Iron Works, Ltd., are doing the steelwork. This is the only sub-contract placed at present. The architects for the work are Messrs. Trehearne & Norman, of Windsor House, Kingsway, W.C.2.

Bayswater.—Reconstruction.—Messrs. J. Jarvis & Sons, Ltd., are doing some building work at Moscow-place, W.2. The work consists of reconstructing and rebuilding the existing mews and garages, and altering to an up-to-date garage, complete with lock-ups and flats over. All the sub-contracts have been let.

Regent-street.—Building.—A new building now being erected at 92, Regent-street, with frontages to Regent-street and Glasshouse-street, has been designed by Messrs. Yates, Cook & Darbyshire, architects for Messrs. H. L Brown & Son, Ltd. Messrs. Hall, Beddall & Co., Ltd., are the principal contractors. Both frontages are being executed in Portland stone. The constructional steelwork is being executed by Messrs. W. H. Blake & Co., Ltd., of Sheffield; the fireproof flooring is of the "Bigspan" design by Messrs. Diespeker & Co., Ltd.

Regent-street.—Building.—A new building has been designed for Messrs. Wilson & Gill, at 137-141, Regent-street. Messrs. Yates, Cook & Darbyshire are the architects; and the builders are Messrs. Hall, Beddall & Co., Ltd. The frontage to Regent-street is being executed in Portland stone by the South-Western Stone Co., Ltd. Messrs. Dorman, Long & Co. are providing and fixing the constructional steelwork, and the fireproof flooring is of the "Bigspan" type by Messrs. Diespeker & Co., Ltd.

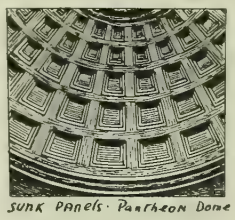
Golden-square, W.—New Building.—A new building is now being erected at 25–29, Golden-square, and 13–17, Warwick-street, London, W., for Messrs. Dormeuil Frères. The architects for the work are Messrs. Mewes & Davis, and the general contractors are Messrs. F. D. Huntington, Ltd., 11, Hanover-square, W.1. The building will be seven stories in height with frontages to both Golden-square and Warwick-street of 118 ft. Steel-framed building with Portland stone fronts. The cost of the contract is approximately £138,000. The following sub-contracts have already been placed:—Steelwork, Dorman, Long & Co., Ltd.; Portland stone, The South-Western Stone Co., Ltd.; fireproof floors, Diespeker & Co., Ltd.; lifts, Waygood-Otis, Ltd.; heating and sprinkler system, Richard Crittall & Co., Ltd.; plumbing and drainage, John Blaikie & Sons, Ltd.; steel shutters, Art Metal Equipment Co.; asphalt, Limmer and Trinidad Lake Asphalt Co.; granolithic and concrete stairs, Stuart's Granolithic Co., Ltd.

Bayswater.—Extension.—Messrs. Bradley's are having an extension made to their premises in Hereford-road at an estimated cost of £40,000. The work includes the extending of the fur department with new cold storage, &c. The architect is Mr. J. A. Bowden, of 30, Craven-street, Strand, W.C., and the building is of a very simple type, not being in a prominent position. The principal sub-contracts are:—Steelwork, Messrs. Smith, Walker, Ltd.; artificial stone, The Empire Stone Co., Ltd. The general contractors are Messrs. F. G. Minter, Ltd., of Putney.

THE ROMANCE OF BUILDING THROUGHOUT THE AGES.—IV

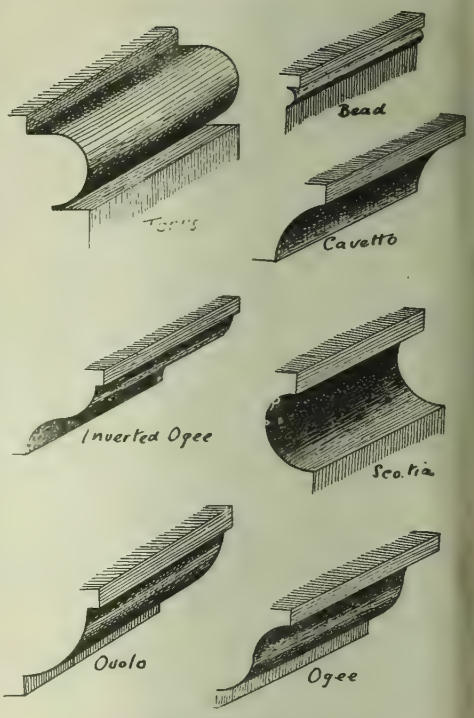
MR. G. W. THOMPSON'S fourth lecture* on "The Romance of Building throughout the Ages," delivered to the Amalgamated Society of Woodworkers (Junior Members), at Liverpool, dealt with the period of Rome from 700 B.C. to A.D. 300.

The lecturer said after conquering Greece the Romans took, as plunder, many of the works of art, and if it had been possible to transport it they would certainly have removed to Rome the complete Acropolis. The Romans built splendid roads, bridges, and aqueducts, but it was not until they learned from Greece and employed Greek artists and artificers that structures of great artistic merit were erected.



Italy was rich in building materials. Rome was built on a volcanic rock called tufa. From Tivoli was obtained hard limestone called travertine. A volcanic stone—peperino—was obtained from Mt. Albano. Besides these, lava and pozzolana and sand and gravel existed in plenty. Pozzolana mixed with lime made excellent concrete. Walls were usually built of concrete and faced with stone.

The Romans adopted the trabeated style of the Greeks, and devised the arcuated style by introducing the arch, vault, and dome. Hemispherical domes or cupolas (cupa=cup) were used for covering circular structures, *e.g.*, the Pantheon, which was the most ancient of existing Roman temples. Although at one time the hall of a bath it was now used as a Christian church (S. Maria Rotondo). Its internal diameter was 142 ft. 6 in., which was also its height. The walls were of concrete 20 ft. thick. The Corinthian columns of the portico were monoliths, 46 ft. 6 in. high. The original bronze door and frame still remained.



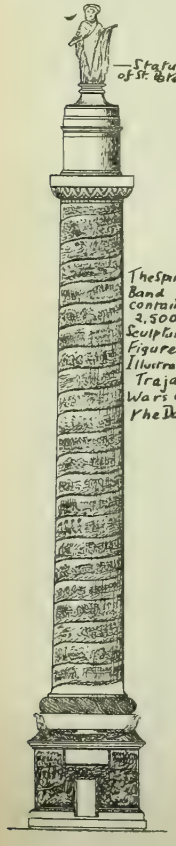
Aqueducts were among the most picturesque of Roman remains, and brought water from the distant hills to ancient Rome. Great quantities of water were needed for the thermæ, or public baths, which contained separate marble halls for cold, tepid, and hot baths, for rubbing and drying, and for games. The walls were ornamented, and mosaic pavements of coloured stone, glass, and marble existed. The baths fell into disuse in the fifth century, following the destruction of the aqueducts by the Huns.

The favourite amusements of the Romans were chariot-races and gladiatorial contests, and for these they built great round or elliptical-shape amphitheatres. The Colosseum was the most striking of these, and was built about A.D. 80. Its shape was that of an ellipse, 620 ft. by 513 ft., and the arena was 287 ft. by 180 ft. The seats were of solid stone, and dens of wild beasts were under the lowest tier. The external façade had four stories, the total height being 157 ft. The elevation was pierced with arches of Tuscan, Ionic, and Corinthian orders.

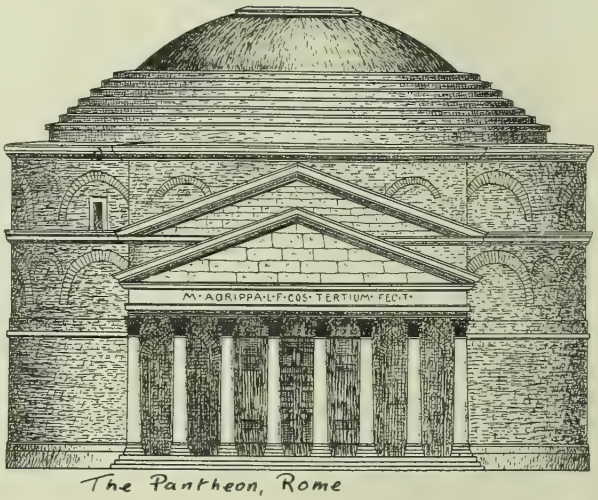
The amphitheatre at Verona was in a splendid state of preservation, and other well-known examples were to be found at Pompeii, Capua, Nimes, and the remains of one at Dorchester, in this country.

The Romans honoured their victorious generals by raising arches or columns as symbols of victory. The arch of Titus remained in good condition. Trajan's Column was another memorial of victory. It was built of Cararra marble and was 147 ft. in height. It consisted of 34 blocks hollowed out, and 182 steps carved in the blocks formed an internal spiral stair. The sculptures around the column numbered 2,500 human figures, besides animals. A full-size cast of the column stood in the Victoria and Albert Museum, London. The column was in the Roman Doric style. A figure of Trajan originally stood on the top, but now a bronze statue of St. Peter overlooked the city.

ROMAN MOULDINGS.

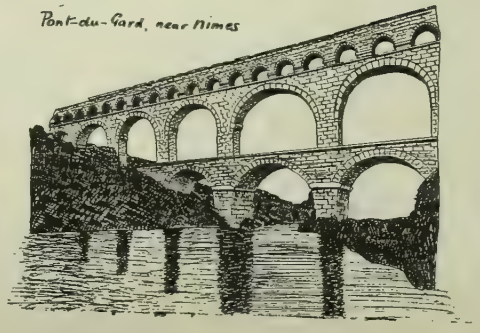


Very famous were the ruins of the Roman Forum, or market-place, which was really the centre of the old city.



With each of the monuments of ancient Rome was associated some important historic event. When the Empire was at the height of its power it was the custom to carve portrait-statues in honour of the rulers. The Empire became less and less powerful, and finally it was conquered by barbarians from the north.

Rome was a city full of art history and of art treasures, and still provided a fruitful home of study for young architects



In some descriptive notes accompanying the slides, the lecturer said the circular portion of the Pantheon was known as the Rotunda, and was erected by the Emperor Hadrian in A.D. 120-124. In front of the Rotunda was the Corinthian octastyle (eight columns) portico, 110 ft. wide and 60 ft. deep in the centre. The eight columns were monoliths. The dome, or cupola, was a hemisphere built partly of brick and partly of concrete. The building was lighted by means of one circular opening 27 ft. in diameter at the crown of the dome; this method of lighting produced an effect both solemn and impressive. The aim of the Romans was to make the Pantheon (the Temple of all the Gods) symbolical of the vault of heaven, the idea being that the worship of Jupiter should take place in a building open to the sky. The dome was originally covered with bronze plates, but these had been replaced by sheets of lead. The ancient Roman bronze door frame, doors, and fanlight, originally plated with gold, still remained.

Among the most picturesque ruins were the arches of the ancient aqueducts that carried water from the distant hills to Rome. The Pont-du-Gard, near Nimes, in France, was the finest existing example of a Roman aqueduct. It was about 900 ft. long, and was formed of three tiers of arches crossing a valley 180 ft. above the river Gard.

The Pantheon, Rome

* Earlier lectures in this series were given in *The Builder* as follows:—I, February 1; II, February 15; III, February 29.

CONTRACTS UNDER SEAL.

The case Nixon *v.* Erith Urban District Council which we noted and discussed in our issue October 26 has been carried to the Court of Appeal, where the decision given in the Court below has been affirmed. It will be remembered that the Council, acting under the Housing of the Working Classes Act, 1890, and the Housing and Town Planning Act, 1919, were putting in force a housing scheme, and the plaintiff, who was a quantity surveyor, acting under the instructions of the defendants' architect, had taken out quantities and was sueing to recover the remuneration agreed upon for this.

The scheme was not carried out in its entirety, but the sole question really decided in the case was whether the action could be brought as the contract with the plaintiff was not under seal. It is not necessary to do more in this present note than to refer to the reasoning of the Court of Appeal on this question under the Housing Acts.

The material sections are Section 56 of the Housing of the Working Classes Act, 1890, and Section 1 of the Housing and Town Planning Act, 1919. Section 56 is as follows: "Where this part of this Act has been adopted in any district the local authority shall have power to carry it into execution (subject to the provisions of this part of the Act with respect to rural sanitary authorities) and for that purpose may exercise the same powers whether of contract or otherwise as in the execution of their duties in the case of the London County Council under the Metropolis Management Act, 1855, and the Acts amending the same, or in the case of sanitary authorities under the Public Health Acts, or in the case of the Commissioners of Sewers under the Acts conferring powers on such Commissioners."

Lord Justice Bankes pointed out that there were four classes of authorities: (1) the London County Council; (2) two classes of sanitary authorities, namely, (a) rural, and (b) urban; and (3) the Commissioners of Sewers: and the object was to confer on each of those authorities power to erect houses for the working classes. Under the Act the rural sanitary authorities had to obtain the consent of their county council before putting any scheme into force, but the other classes were free to act without obtaining such consent.

It was then pointed out that this section was not well drafted, but the powers given to each authority were not cumulative, but were given to each authority separately in respect of the erection of working-class houses, and the section must be read distributively. Under that reading of the section the powers of an urban sanitary authority "whether of contract or otherwise" were derived under the Public Health Acts, and Section 174 of the Public Health Act, 1875, provides "Every contract made by an urban authority whereof the value or amount exceeds £50 shall be in writing and sealed with the common seal of such authority." Section 1 of the Housing and Town Planning Act, 1919, which compels the local authorities to adopt Part III of the principal Act of 1890, it was held made no difference, for it was only under Part III of the principal Act that they derived their powers to make any contract in respect of a building scheme.

The above is a short summary of the effect of the judgment of Lord Justice Bankes (the only judgment at present reported of the three Lords Justices) as reported in the *Times*, February 21, but it seems to make the matter clear.

The bad drafting of Section 56, it will be seen, has been the cause of some doubts, for the section is not even grammatical English, but the above interpretation makes it clear that the several authorities mentioned derive their powers severally from the Acts specified.

Builder's Estate.

Mr. Thomas Start (71), of St. Anne's, Walton-road, Bognor, Sussex, builder (net personalty £1,169), £17,598.

RATES OF WAGES IN THE BUILDING TRADE.

The following are the rates of wages in the building trade in England and Wales. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur:—

	Masons.	Brick-layers.	C'p'ters. Joiners.	Plas-terers.	Slaters.	Plum-bers.	Painters.	Labourers.
Aberdare	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Accrington	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Altrincham	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Ashton-under-Lyne	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Barnsley	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Barrow-in-Furness	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Barry	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/7½	1/2½
Bath	1/5½	1/5½	1/5½	1/5½	1/5½	1/5½	1/5½	1/1½
Bedford	1/5	1/5	1/5	1/5	1/5	1/5	1/5	1/0½
Birkenhead	1/9	1/9	1/9	1/9	1/9	1/9	1/9	1/4

(For rates of wages in the Building Trade in Scotland, see page 437).

THE SCOTTISH BUILDER

ARCHITECTURE AND COMMERCE

MR. T. P. MARWICK, F.R.I.B.A., President of the Incorporation of Architects in Scotland, lectured recently on this subject at the Victoria Art Galleries, Dundee. Mr. Charles G. Soutar, F.R.I.B.A., the President, occupied the chair.

In the course of his remarks the lecturer said in present times one found a great amount of misunderstanding and lack of appreciation among many educated people as to the part which architects filled in this world. Their labours did not receive the recognition and publicity they merited. Publicity stimulated interest, and the success of art in the long run depended upon public interest. Beautiful buildings educated the people, and in the course of time they would, if worthy, raise the whole tone of public taste throughout the country. All who did good artistic work should be suitably rewarded. Yet how seldom did anyone in this country take the slightest interest as to who was the designer of a particular building. It was only last year that a medal had been instituted in London for presentation to the architect who produced the most beautiful street frontage, and something on similar lines was done in Birmingham. There was now to be one quinquennially for Scotland. That was all in the right direction, for so long as men of conspicuous talent were unappreciated and their most earnest efforts passed by without intelligent criticism and recognition, they would be discouraged and mediocrity would abound. In the United States of America a very marked advance in architectural talent had taken place, largely coincident with the bestowal of patronage of those connected with commerce and the stimulation of public interest.

He hoped in a short time they might have in Scotland, as there was already in Cambridge London, Liverpool, and other English cities, a University degree in Architecture. This ought to be placed within the reach of all men in training. It would give the imprimatur of the University and help to improve the quality and status of the profession. This had already been arranged for at Glasgow University, and in Edinburgh they were working towards the same end. He hoped Dundee would follow. It would also be well if in every city or town a Consultative Art Committee were elected to co-operate with the local authority. This had recently been done in Edinburgh and Birmingham, and one hoped to see such action followed everywhere, for he was convinced that it would be beneficial.

ABERDEEN BUILDING WAGES.

THE following minute of agreement has been arrived at between employers and employees in the mason, plumber, slater, joiner, and wood-cutting machinists trades in the city of Aberdeen: "The parties mutually agree that the rate of wages be increased to 1s. 7½d. per hour on March 7, 1924 (from 1s. 7d.), and from that date that the Aberdeen wages be adjusted under an agreement which will stipulate a rate equal to that adopted by the Scottish National Building Trades Federation employers; and either party reserves the right to revise this agreement as at February 1, and August 1, yearly, at two months' notice." This will mean an increase of one halfpenny per hour to about 1,600 employees in the Aberdeen building trades.

The Architect in India.

Mr. John Begg recently delivered a lecture, illustrated by lantern slides, to the members of the Glasgow Institute of Architects on this subject. In the course of his remarks he said modern architectural practice in India was a comparatively negligible quantity at the beginning of the present century, when it received a stimulus as a result of the Government action of introducing the recruitment of architects from home to the Public Works Department of India. Even at the present time, however, architectural practice was still a small affair compared with the vast opportunities which the country offered. For many years India would require careful nursing, during which time everything would depend on the lead which the Government gave to the public in India with respect to the profession. He predicted a great future for architects and architecture in India. How soon that would begin to be felt, however, depended upon many matters, of which the important strings were partly held by the Government and partly by architects. There was a living tradition of craftsmanship and design still existing in India in a somewhat feeble state of vitality, and it was for the people of this country to keep that tradition alive, foster it, and give it a new lease of life. In that tradition lived the germs of India's future architecture. Mr. Begg illustrated his lecture with a series of lantern slides showing many examples of the work executed by members of the Public Works Department.

Tidying Edinburgh.

The Edinburgh Corporation Lighting and Cleansing Department Welfare Club held their fourth annual meeting recently. Lord Provost Sleigh presided. In the course of his remarks he said he appreciated very cordially the services rendered by the department, and he recognised how much was due to the staff for the efficient manner in which they carried out their laborious duties. The club had engaged in excellent work, and he understood they had present in the hall a hundred scholars, from schools in the centre of the city, who had been invited by the executive committee of the club in token of their appreciation of the services rendered by the children in the campaign against the chalking and marking of buildings, and the throwing of wastepaper on the streets.

Health and Home Exhibition.

The arrangements for the holding of this exhibition at Aberdeen, from the 15th to the 22nd of this month, have all been completed. All the space for stands has been let out, and there will be over 40 exhibitors, representing the leading firms in Aberdeen and various parts of Scotland and England.

There will be numerous working exhibits, and continuous demonstrations of labour-saving devices.

NEW BUILDINGS IN SCOTLAND

Aberdeen.—SHED.—The Tramways Committee has instructed the Burgh Surveyor to issue specifications for erecting a new shed at King-street to accommodate 24 tramway cars. The estimated cost of the addition is £16,000.—The T.C. has accepted a tender of £39,000 for the erection of 86 houses at Torry.

Dundee.—REBUILDING.—The E.C. are considering the question of rebuilding the old gymnasium in Ward-road.

Ayr.—HOUSE.—Plans have been passed for a house at Seafield, for Mr. J. Anderson. The estimated cost being £800.

Musselburgh.—HOUSES.—The T.C. has accepted tenders for the erection of 28 houses, amounting to £11,983.

Edinburgh.—ADDITIONS.—The house, No. 21, Grosvenor-crescent, has been acquired for an addition to the Theological College of the Episcopal Church by the Representative Church Council.

Troon.—VARIOUS.—The Dean of Guild Court has passed plans as follows:—W. Mills a building, West Portland-street, at an estimated cost of £400; A. E. Howell, additions to Sandford, Harling-drive, estimated to cost £200; and Mrs. K. Murphy, Ardaghy, an addition to a house, Morven-crescent, at a cost of £200.

Renfrew.—EXTENSION.—Plans have been passed by the Dean of Guild Court as follows:—Rebuilding and extension of dairy premises in Paisley-road, for Mr. J. Love.

Oban.—CONVERSION.—The Dean of Guild Court recently approved of plans submitted by the Oban and Lorn District Co-operative Society, Ltd., for the conversion of a store at the rear of Kimberley Buildings into a bakery.

BUILDING TRADE WAGES IN SCOTLAND.*

THE following are the present rates of wages in the building trade in the principal towns of Scotland. Every endeavour is made to ensure accuracy, but we cannot be responsible for errors that may occur:—

	Masons.	Brick layers.	Carpenters, Joiners.	Plasterers.	Slaters.	Plumbers.	Painters.	Brick-layers' Labourers.	Masons' Plasterers' Labourers.
Aberdeen	1/7½	1/8½	1/7½	1/8	1/7½	1/7½	1/4½	1/0½	
Airdrie	1/7½	1/7½	1/7½	1/8	1/7	1/7	1/6½	1/2¾	
Alexandria	1/7½	1/7½	1/7½	1/8	1/7	1/7	1/6½	1/2½	
Arbroath	1/6½	1/6½	1/6½	1/7½	1/6½	1/6½	1/5½	1/1½	
Ayr	1/7½	1/7½	1/7½	1/8½	1/7½	1/7½	1/6½	1/2¾	
Bathgate	1/7½	1/7½	1/7½	1/8	1/7	1/7	1/6½	1/1½ to 1/2½

* The information given in this table is copyright. The rates of wages in the various towns in England and Wales are given on page 481.

CONTRACTS, COMPETITIONS, &c.

Forsome contracts still open, but not included in this List, see previous issues. Those with an asterisk are advertised in this number. Certain conditions beyond those given in the following information are imposed in some cases, such as that advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in; the name and address at the end is the person from whom or place where quantities, forms of tender, &c., may be obtained.

Junior Institution of Engineers.

On March 7, Mr. P. M. Fraser, F.I delivered a lecture on "An Introductio Study of Fire Danger in Factories, wi Notes on Fire Insurance," at the Junior tion of Engineers.

The lecturer gave an account of the ment of fire insurance offices and fire l and explained how the fire offices fix t so as to make each particular trade pa own losses. By complying with cert ditions laid down by the Fire Offic mittee, the normal rates of insurance obtained, and in addition special indu were offered in the way of discounts extinguishing devices. The causes of above the normal rate were enumera included multi-story buildings, cubic of buildings above a prescribed limit, cor partitions, well holes, elevator shafts and engines, and certain methods of and lighting.

The efficacy of sprinklers seemed to b by statistics, showing that only in a per cent. of the total number of fires in fitted with sprinklers was the installatio to cope with the fire, excluding cert in which the water had been shut o installation was out of order. For work, the lecturer explained, it was ess have a non-conducting fluid, and for of fires the extincteur of the foam most suitable. With the foam type, l less damage was done to textile an goods. Ferro-concrete was noticeabl ability to withstand intense heat and

Sea-coast Site for Disposal.

The Corporation of Wallasey is of a lease of 999 years an area of 13,500 land at New Brighton, to be used for th of buildings which will increase the am the Borough. It is stated that the si ticularly suitable for residential purp that there would be good opportuniti hotel, a club, or a theatre. Full partic be obtained from Mr. L. St. G. W Borough Engineer, Wallasey.

"A Perfect Solution"

An Architect writes: "*The cradles are, in my opinion, a perfect solution to the difficulties with all types of roof principal connections.*"

The Cradle Truss does away with the many disadvantages of the all-steel truss. It is made of timber and steel—each being put to its most efficient use—timber for compression members, steel for tension. The scientific application of this combination is one of the chief factors in the success of the Cradle Truss.

The Reasons why Cradle Trusses are so popular and efficient:—

1. The tension bars being in pairs, give greater lateral rigidity
2. These bars being round reduce the possibility of corrosion to a minimum. 3. Adjustable joints. 4. Fine appearance. 5. The cradle joints are so easy to paint.

Other reasons and quotations for spans up to 80 ft. will promptly be supplied.

Bonaly-road, Colinton; Thomas M'Crae, conversion of self-contained house, Learmouth-terrace, into three separate dwellings; J. W. Wallace, bungalow, Meadow-place-road, Corstorphine; J. D. Johnston, bungalow Hillview-terrace, Corstorphine.

GLAMORGAN.—The Gower R.D.C. is to borrow £6,470 to carry out the Llanmorlais-road improvement scheme.—The Radyr Golf Club is to undertake pavilion and other building works, at an estimated cost of £2,500.—The G.W.R. Co. has notified the Merthyr Tydvil B.C. that it will carry out repairs to, and make enlargements to, Quaker's Yard station.—The B.E. has advised the Mountain Ash E.C. that it is of opinion that the Committee should erect a central school at Ynysybwl. The Committee has already provided in its estimates for erection of a central school at Abercynon, and the enlargement of Miskin School, Mountain Ash.—The C.C. is to acquire land for extension of the mental hospital at Angleton, and is to carry out reconstruction of Pontardawe Police Station.

HAVERFORDWEST.—Plans passed by T.C. are as follows:—Two houses at Portfield, for Mr. Jenkins, Gowerton (Mr. Butler, architect). The Council is to invite tenders for supply of stone, tar-spraying, liquaphalte, and general haulage for a period of twelve months.

HAWORTH (YORKS)—Plans have been prepared for the erection of a new Roman Catholic Church at Craven Royd, Haworth.

HINCKLEY.—Plans for 142 houses have been passed by the U.D.C.

HORBURY.—Plans passed: House off Jenkin-road, for Mr. J. Dyson; house, hotel for J. Yetley & Sons, Ltd.; two houses in Windyridge-street for Mr. E. Lord.

KIDDERMINSTER.—The T.C. decided to invite tenders for the alterations, improvements and reconstruction of the cattle and wholesale markets—separate tenders to be invited. The Surveyor's estimated cost is £10,000.

LEEDS.—The Church Extension Society has secured sites for new churches to be erected on the new Housing Estates at Hawkesworth, Middleton and Meanwood. They hope to commence building this year.—Plans have been prepared and tenders are being invited for the completion of Atlas Chambers Rebuilding Scheme in King-street and Park-place. Messrs. Perkins & Bulmer, of Infirmary-street, Leeds, are the architects.

LLANELLY.—The Council is to undertake the repairing of the schools buildings in the area, at an estimated cost of £7,500. The estimated cost of re-roofing the Boys' Central School is £2,500.

LONDON.—The Metropolitan Asylums Board propose to make arrangements for 24 single rooms for patients at Colindale Hospital at an estimated cost of £2,050.

LONDON (HACKNEY).—Plans passed by B.C.: Factory premises at Victory Works, Theydon-road, for T. D'Amery; workshop, Silesia-buildings, Mare-street, for Hall, Beddall & Co.

LONDON (LEWISHAM).—Plans passed by B.C.: Building, Randlesdown-road, for Bethell & Swannell; four houses, Belmont-hill, for L. Shore; six houses, Warren-road, for Dibben & Co.; 10 houses, Bellingham-road, for H. R. Watt; house, Belmont-hill, for A. G. Shorter; four houses, Woolstone-road, for Nichols, Aitchison & Budd; premises, High-street, for T. H. Sawyer & Son.

LUTON.—Plans passed by T.C.: C. T. Archer, three houses, Stockingstone-road; Mrs. S. A. Taylor, bungalow, Turner's Knoll; N. Hill, three houses, Lincoln-road; N. Hill, two houses, Mansfield-road; R. V. How, four houses, Portland-road; C. J. Perkins, house, Kingston-road; A. Mardle, four houses, Biscot-road.

MACCLESFIELD.—A new post office is included in the Draft Revenue Building Estimates.

MAIDSTONE.—Plans passed by T.C.: Loose-road, bungalow for Mr. G. Wilkinson and two bungalows for Messrs. W. T. Burrows & Son; Curzon-road, two houses for Mr. J. Barton; St. Peter-street, concrete gantry for the Maidstone Gas Co.; Willington, lock-up shop for Mr. W. S. Girling; Mill-street, rebuilding No. 4, for Messrs. G. H. Leavey & Co.

MANCHESTER.—New schools on three building estates, costing £14,700, £32,000, and £22,000 respectively; extension of the Municipal College of Technology, £180,000; junior technical school in Hulme, costing £35,000; school for mental defectives and a teachers' training college at Parr's Wood; and a proposal to build a secondary school in Levenshulme.——Plans passed by the Manchester Corporation: Alterations to "Blue Post" Inn, 55, Vine-street, Hulme; Saxone Shoe Co., Ltd., alterations and additions to premises, 90, Stretford-road, Hulme.——Manchester University: Revised details of foundations addition to Museum of Manchester University, Oxford-street.

MARKET HARBOROUGH.—A site has been acquired in Northampton-road for the erection of new offices for the Market Harborough Building Society.

MARSDEN.—The U.D.C. are awaiting the approval of the M.H. for erection of fifty houses.—Estimates are to be prepared for the remodelling of the sewage works.

MIDLOTHIAN.—The Calder and District Committee has decided to erect twenty-four houses.

MILNROW.—The D.C. approved plans for the erection of 12 pairs of semi-detached houses and pair of semi-detached houses in Buckley Hill-lane.

MONMOUTHSHIRE.—The Ebbw Vale U.D.C. E.C. recommends Council to erect new school at Glyncoed at estimated cost £24,000, and effect enlargements to Tyllwyn Schools at an estimated cost of £5,000.—The widening, reconstruction and improvement of Aberbeeg bridge, at an estimated cost of £22,500, is proposed to be undertaken by the C.C. and certain of the U.D.C.s.—The Tredegar U.D.C. has now approved the scheme to provide high levels water supply, the estimated cost of the scheme being £8,000. The U.D.C. has passed plans for two houses to be erected in Church-avenue by Mr. W. Edwards, Tredegar.—An unemployment relief scheme is being considered by the Pontypool B.G. involving the construction of a new road from Little Mill to New Inn.—Drastic alterations to the Blaenavon Park-street Mixed Council School are to be carried out by the C.E.C., and involve expenditure of £2,000 on rebuilding work alone. The work will be put in hand immediately.—The Chepstow R.D.C. is endeavouring to arrange for a site for erection of a new landing stage in which the Chepstow Development Association will have interests.—The Management Committee of the Victoria Cottage Hospital, Abergavenny, has decided to build a children's ward, at an estimated cost of £1,?00, and work will shortly be put in hand.—The Ebbw Vale Central War Memorial Committee will shortly put in hand work of erecting memorial, at an estimated cost of £1,600.

MUSSELBURGH.—The T.C. has agreed to proceed with the widening of the new stone bridge over the Esk, with relative tramway track improvements, at a cost of £17,665, according to the offer of Messrs. Angus & Sons, Edinburgh.

NEWTON ABBOT.—Plans passed by U.D.C.: Gospel Hall, at Kingsteignton; pair of cottages, at Kingsteignton, for Messrs. L. G. Frost & S. E. Jeffery; bungalow, at Dawlish Warren, for Mr. J. B. Carmichael.

NORMANTON.—Plans passed: House at Mill-hill, for Mr. J. W. Fox; four houses in Gladstone-street, for Mr. H. Robshaw.

OLDHAM.—The Parks and Cemeteries Committee are to consider improvements to the chapels in the Chadderton and Greenacres Cemeteries.——Plans have been approved by the B.C. for the Heron-street Higher Standard, Centre-street (Messrs. Taylor & Roberts, architects).

OSSETT.—Plans passed by T.C.: Two houses, Swithenbank-street, for Mr. A. E. Clegg; house at Sowood View, for Mr. John Baker; two houses in Wesley-street, for Mr. Jarvis A. Brook; house in Wheatcroft, off Church-street, for Mr. Gladstone Moorhouse; detached house off Church-street, for Mr. A. Mitchell; three houses in Spa-lane, for Mr. Joseph Illingworth.

PAISLEY.—Plans passed: Mr. J. Macfarlane, three bungalows at Calside; Mr. H. Neil, bungalow, Gartmore-road.

PLYMOUTH.—Alterations and improvements estimated to cost £10,000 are projected at the South Devon and East Cornwall Hospital. The improvement of the mortuary has already been taken in hand, and the committee hope to embark shortly upon the erection and equipment of a laundry at a cost round about £5,500. The enlargement of the pathological department and the X-ray department are also contemplated, together with the remodelling of the entire hospital.

PONTARDAWE.—The R.D.C. has instructed the architect to procure tenders for erection of 22 houses at Colbren-road site, Gwaun-cae-Gurwen.

PONTYPRIDD.—The U.D.C. has applied for sanction to erect 100 houses, and has instructed that tenders be invited for erection of the houses in batches of twenty. The Council is negotiating for building sites at Graig-yr-hesg and Lan Wood.

PORT ISAAC.—Messrs. Lewis & Lewis, consulting engineers, London, have prepared a scheme for submission to the Cornwall C.C. for the provision of harbour shelter at the fishing centre of Port Isaac, which is exposed to heavy ground seas from the Atlantic. They propose a breakwater 200 ft. long. The cost is estimated at £19,600.

PRESTATYN.—Plans passed by U.D.C.: Bungalow, Highbury-avenue, for Miss Lucy Thacker; house, Plas-avenue, for Mr. Jos. Edwards; house, 3, Bryntirion Estate, for Mr. S. F. Hopley; semi-detached houses in Gronant-road, for Mr. Robert Wallace; semi-detached houses, Bryntirion-drive, for Mr. J. Williams; house, Bryntirion-drive, for Mrs. Boler; house, Bryntirion-drive, for Mrs. E. H. Halliwell and Miss A. Whitehead; semi-detached houses in Glyn-avenue, for Mr. Hugh Jones and Mrs. Lyde; residence in Woodland Park, for Mr. L. T. Williams.

READING.—The T.C. has adopted plans and sections prepared by Messrs. C. Smith & Sons, architects, for additions to the Park Hospital, estimated to cost £14,820.

REIGATE.—Plans passed by T.C.: J. Hodge & Son, two houses, Rushworth-road; E. Penfold, house, West-street, and pair of houses in Orchard-road; W. Farmer, house, Oak-road; Vincent Hooper, three houses, Redstone-road; Harry G. Clacy, house, Crakell-road; H. G. Donnison, house, Chart Field-road; A. J. Vinson, pair of houses, Chart-lane.

ROTHERHAM.—The Justices have passed plans for the conversion of the Electric Picture House into billiard-rooms, shops, &c., and for the rebuilding of the Cleaver Inn, Wellgate.

ROTHERHAM.—At a recent meeting of the R.D.C. it was stated that the Rother Vale Collieries, Ltd., were prepared to erect twenty-five houses at Treeton if the Council would undertake to erect a similar number.—The Cortonwood Collieries are prepared to erect two hundred houses at Brampton Bierlow if the Council would undertake to erect approximately the same number.—The R.D.C. are making application to the M.H. for sanction to borrow £10,390 for new sewage disposal works in the parish of Brampton Bierlow.

ROYTON.—An application to the D.C. has been made by the Co-operative Society for a store site in the Ooze Wood Housing Estate.——Plans were approved for subsidy for a block of three houses, block of four houses, block of five houses, all in Shaw-road, not in accordance with Ministry requirements, partly built old parlour type; pair semi-detached houses, Springfield-lane; pair of semi-detached houses, Springfield-lane, parlour type.

SCARBOROUGH.—The railway station at Scarborough will soon be extensively altered. The alteration will consist of considerable improvements to the parcels and lift luggage departments. Building operations will be expedited as much as possible so as to have the scheme completed in time for the summer rush. The contract will be let by tender. The architect for the work is Mr. Stephen Wilkinson, York.

SKEGBY.—Colliery developments at Blidworth will soon be altering the aspect of this old village, for it was stated at the last meeting of the R.D.C. that the Industrial Housing Association, Ltd., proposed forthwith to commence the erection of 100 houses, and to proceed by stages until 850 to 1,000 houses are built. Eventually it is believed something like 2,000 houses will be erected. The R.C. is to confer with the engineer of the Association as to the sewerage scheme which will be necessary. At present there are only 200 houses in Blidworth.

SOUTH SHIELDS.—Plan passed: House and shop, Prince Edward-road, Messrs. T. A. Page & Son, for Mr. Blunden.

STALYBRIDGE.—A faculty has been obtained for installing a new stained-glass window in the west side of St. Paul's Church: and to place an alabaster tablet in the chancel, estimated to cost £?00.——The Surveyor has been instructed to prepare plans and obtain estimates of cost for the conversion of West Hill into a school for the higher standards for boys, with a handicraft centre.

STRETFORD.—Plans passed by U.D.C.:—Twelve houses (subsidy), Wellington-street, for Messrs. Howard & Sons; two houses, Urmston-lane, for Messrs. Jones & Thomas: sewering, &c., Derbyshire-lane West, Addison-road, Skelton-road, for the de Trafford Estates conversion to shop, 27, Isabella-street, for Mr. W. R. Dykes.

STOCKTON.—The General Purposes Committee of the T.C. have had before them sketch-plans for the new municipal buildings, which, in view of the offer of the London & North-Eastern Rly. Co. to supply an alternative site for the cattle market, it is now proposed to erect on the existing cattle market. It is proposed that the scheme be carried out in three sections, the first providing accommodation for the Town Clerk, Borough Engineer, Borough Accountant, and Medical Officer, at an estimated cost of £40,000, the second section, at a cost of £70,000, and the third at £40,000, giving the total cost of the scheme at £150,000.

SWANSEA.—The Higher Education Sub-Committee has decided on a scheme for extending the Technical College at a cost of £100,000.

TADCASTER.—Plans passed by R.D.C.: Eight houses in Belcroft-lane, for Mr. L. J. Gallagher; three houses in Newton-road, for Messrs. C. & S. Robinson and J. Goodall; bungalow at The Drive, Station-road, Scholes, for Mr. G. McConnell; two houses at Owlett-lane, Kippax, for Messrs. E. & A. Davies; two houses at Owlett Hall-lane, for Messrs. A. Barton and M. Booth; two houses at Owlett Hall-lane, for Messrs. S. Roberts and E. Hastings; fifty houses at Swillington, for Messrs. T. & R. W. Bower; house at Brigshaw-lane, Allerton Bywater, for Mr. C. Stockwell.

THORNE.—Sinking operations at No. 1 Shaft are now within reach of the Barnsley seam, surface buildings are being erected, and building operations upon the new village and new elementary school are about to be commenced.

TORPOINT (CORNWALL).—The U.D.C. propose to construct a road bridge across the River Tamar between Devonport and Torpoint.

THURCROFT.—The United Street Companies have decided to erect 100 more houses on the Laughton-road site and the Rotherham R.C. have also decided to build 100 more on the site known as Katherine-street.

WALLSEND.—The M.H. has sanctioned the T.C.'s proposal to borrow £13,860 for the erection of 36 houses, at High Farm, and £12,776 and £1,586 for street and sewer works.

WALLASEY.—Plans passed by T.C.: Two houses, office and workshop in Mill-lane, for Mr. E. M. Bellis; seven houses and garages, Broadway-avenue, for Mr. H. W. Jones; house, Leasowe-road, for Mr. C. L. Nicklin; three houses, Breck-road, for Messrs. J. McKee & Son; four houses, Lymington-road, for Mr. W. J. B. Bellis; six houses, Hillside-road, for Mr. E. A. Hawke; 15 houses, Willoughby-road and Dawlish-road, for Mr. W. Stocks; conversion of shop, 125, Poulton-road, into house and shop, for Mr. A. Bell; bakehouse, &c., at No. 72, Albion-street, for Miss Hardman; two houses, Cliff-road, for Mr. J. P. Jones; two houses, Poulton-road, for Mr. J. Hall; 10 houses, Rolleston-drive, for Mr. G. A. Lindley; six houses, Dawlish-road, for Mr. W. J. B. Bellis; offices, Church-road, for Mr. George Russell; seven houses, Lymington-road, for Mr. J. H. Holland; street on the "Fox Hey" Estate, Breck-road, for Mr. G. A. Lindley; seven houses, Pendennis-road, for Mr. T. Owen; two houses, Grosvenor-road, for Messrs. Young & Broster; 26 houses, Uppingham-road, for Mr. J. H. Lindley.

WALTON-LE-DALE.—The Surveyor reported that the cost of the removal and re-erection of the building at Bell's-lane and Houghton-lane, in order to improve a dangerous corner, would be £110; and the cost of making a new road to the east of the farm, £1,500.——Notice has been received that the Preston and Blackburn Corporations intended laying a main to connect the two electricity stations along the old tram road, Hennel-lane, Chorley-road, Higher Walton-road, and Houghton-lane.

WALTON-ON-THAMES.—Plans passed: Messrs. Crouch & Co., eight bungalows, Mount Felix Estate; W. A. Annett, two bungalows, Terrace-road, and two bungalows, Cottimore-lane; Trigg & Son, bottling factory, High-street.

WARRENPOINT.—The Northern Ministry o Home Affairs has given permission to the U.D.C. to borrow £2,829 to enable it to carry out improvements in the town. These include the erection of shelters for visitors and the repair of the promenade roadway.

WEYMOUTH.—Plans passed by T.C.: S. Jackson & Sons, pair of villas on allotment ground, Argyle-terrace, for Mr. W. E. Barrett; Jenkins, Hitt & Grant, Ltd., bungalow, Fernhill-avenue; F. J. Purchase, four houses, Roman-road.

WIGTON.—Plans passed by R.D.C.: Additions to Mr. Little's property at Kirkbride, and additions and improvements to a farm at Kirkland, for Mr. W. Simpson, High-street, Maryport.

YORK.—It is proposed to build a new church in the South Bank district of York. The architects are Messrs. Brierley & Rutherford, Lendal, York.

FIRES.

EDINBURGH.—Fire, causing damage to the extent of several thousands of pounds, has occurred in the premises of Messrs. M'Vitie & Price, Ltd., biscuit manufacturers, Robertson-avenue.

STOKE-ON-TRENT.—Great damage has been caused by a fire which destroyed the saw mills of Messrs. John Foster & Sons,

BUILDING IN CANADA.

The official review of building permits issued in Canada during 1923 states that activity in building for a total of 56 cities was somewhat less in 1923 than during 1922, but much greater than in both 1921 and 1920.

An analysis of the returns by provinces shows that the value of the building permits issued in Quebec and Ontario was higher than in 1922, 1921 or 1920.

The largest aggregate of building permits issued in any one city was again reported in Toronto. Montreal recorded the next largest total, and the township of York (a suburban area adjoining Toronto) was the third largest total in the Dominion. Considerable activity was shown in Vancouver, although the total was 28 per cent. less than in 1922, but permits then had been exceptionally high on account of authority having been granted for the construction of a Government pier. The city of Hamilton took fifth place in the record of individual cities. Quebec, Windsor and Winnipeg came next in order.

A review of the reports by months shows that the highest total was recorded in April, when the permits issued were 15 per cent. of the total for the twelve months.

Reports as to the number and value of permits for houses, other buildings and engineering contracts were furnished by a number of cities; forty-four centres made returns showing that they had issued permits for 12,900 dwellings. The number of permits issued for other buildings including garages, stables, stores, factories, &c., was almost 22,200. In addition, permits for some 200 engineering projects were granted.

In British Columbia the value of the permits issued in 1923 was less than in 1922; this, as has already been pointed out, was due to the fact that a permit was granted in the latter year for a government pier in Vancouver.

Activity in Nova Scotia attained its highest level in the period immediately succeeding the Halifax explosion of 1918. The total for that province in 1923 was smaller than in any other year of the record. The value of building authorised in New Brunswick was less than in any other post-war year.

THE RENT ACTS: NOTICE OF INCREASE

The case Michael *v.* Phillips which we noted March 30 last has been carried to the Court of Appeal, where the decision has been affirmed.

The case raises some interesting questions, and the facts were as follows:—By an agreement in writing, dated May 22, 1918, one Michael, since deceased, had let to the defendant a flat at Hampstead for a term of one year and seven-eights at a rent of £107 18s., the landlord paying rates and taxes. The standard rent of the flat was £107 18s., and it only came within the Rent Act because the rateable value was £105 and, therefore, just within the limits of the Act. The term above granted was to run from May 9, 1918, and thus would terminate March 25, 1920, but on February 17, 1920, and thus before the determination of the agreement, the plaintiffs, the executors of Michael, had demised the flat to the defendant for a further term of seven years from March 25, 1920, at a rent of £160 a year.

No notice of intention to increase the rent had been given, and the Act of 1920, which requires such notice to be given, did not come into force until July 2, 1920. In this action the plaintiffs were claiming one quarter's rent due June 24, 1922, and the defence to this claim was that as no notice of increase had been given the increased rent could not be claimed, and while admitting liability for £26 15s., a quarter's rent at the standard rent, the defendants counterclaimed for £125, payments made in excess of the standard rent.

As regards the defence and counterclaim the plaintiffs raised two points: (1) That no notice of increase was necessary as the Act of 1920, requiring notice, was not in force at the time when the rent was increased; and (2) that the rent included payment in respect of attendance, and therefore under section 12 subsection (2) (i,) the Act did not apply to the flat. On this second point the evidence was that the landlords provided a lift, with a porter to attend to it, who every morning, except on Sundays, by the lift removed the tenant's refuse and carried up coals from the tenant's cellars from and to a place outside each flat, but the lease contained no covenant by the lessors to provide a lift and porter to render services.

The Court of Appeal affirmed the decision of the Divisional Court, and held that notice of intention to increase the rent as prescribed by section 3 subsection (2) was a condition precedent to the lessors' right to increase the rent, and it was immaterial that the lease purporting to make the increase was made before the passing of the Act, and on the second question the Court of Appeal held that as the lease contained no covenant to supply attendance section 12 subsection (2) proviso (1) did not apply to take the flat out of the Act.

On the first of these two points in the Divisional Court it had been also held that as the new lease had been entered into before the expiration of the original term the landlord had never, under section 3 subsection (1) been in a position to give notice of an increase because there had never been "a period during which but for the Act the landlord would be entitled to obtain possession."

As we pointed out in our note to Schmitt *v.* Christie (*The Builder*, July 4, 1922), and to Michael *v.* Phillips when heard in the Divisional Court (*The Builder*, March 30, 1923), very difficult questions have arisen under the Act as interpreted by these decisions. The standard rent when once it has been ascertained attaches to the house *in rem* (see King *v.* Yorke, *Weekly Notes*, 1919, p. 59; *The Builder*, February 28, 1919), and an increase of rent can only be demanded even in the case of a new tenancy when the requirements of the Act have been complied with (see Schmitt *v.* Christie, and Michael *v.* Phillips).

Those conditions are that the landlord must be in a position to give a notice of increase under section 3 subsection (1), that is, no increase is authorised except in respect of a period during which but for the Act the landlord would be entitled to obtain possession, *i.e.*, when the tenancy has determined either by notice or otherwise, and that a notice of increase in accordance with subsection (2) of the Act has been given, that is, a four weeks' notice. If a change in the tenant does not get rid of the standard rent as was held in Schmitt *v.* Christie, it is difficult to see how the new tenant can be effected with notice of increase. The term is still subsisting as against the old tenant in the case we are imagining, and notice of increase cannot have been given to him because of subsection (1) the landlord not being in a position to obtain possession, and the new tenant cannot be effected with notice because it is a four weeks' notice, and if he comes in, at the end of four weeks the position is the same as regards subsection (1), as in the case of the outgoing tenant, for a term is again subsisting, and the landlord is again not in a position to obtain possession.

There appears to be a flaw in the Acts for when once an increase of rent has been lawfully made it should be the standard rent plus the permitted increase which should attach to the house, and not merely the standard rent unincreased. The only question we have now to consider is whether the new Acts of this year have made any difference.

The Rent Restriction Act, 1923, which came into force July 31 last does seem to some extent to remove this difficulty, for under section 2 subsection (1) where a landlord is in possession of the whole of the dwelling house at the passing of the Act, or comes into possession of the whole house at any time thereafter, then (provided that he has not come into possession under an order or judgment made after the passing of the Act on the ground of non-payment of rent) the principal Act ceases to apply to the house from the passing of the Act, if the landlord is then in possession, or from the date when he came into possession.

By subsection (2) also, where at any time after the passing of the Act the landlord of a dwelling house to which the principal Act applies grants a valid lease to the tenant for a term ending at some date after June 24, 1926, being for a term of not less than two years, or enters into a valid agreement for a tenancy of such term, from the commencement of the term the principal Act shall cease to apply to the dwelling house. This subsection it will be seen applies only to the tenant, that appears to be to the tenant in possession.

These two subsections also contain provisions as to parts of houses. But it is particularly important to notice that the word "possession" in subsection (1) is construed by subsection (3) to mean "actual possession, and a landlord shall not be deemed to have come into possession by reason only of a change of tenant made with his consent."

Thus the position seems relieved by the Acts passed this year, but from the above observations we hope it is clear that a new lease or agreement to a different tenant must under no circumstances be granted before possession is obtained, as otherwise the difficulties illustrated by the case Schmitt *v.* Christie and Michael *v.* Phillips will be experienced.

In conclusion, it may be noticed that although the Rent Restriction (Notices of Increase) Act, 1923, gives to a notice to increase the rent the character of a notice to terminate an existing tenancy, it only so operates where an effective notice to quit can be given, and thus the limitation contained in section 3 subsection (1) of the principal Act, that the increase can only be demanded in respect of a period during which but for that Act the landlord would be entitled to obtain possession still applies; and further it must be remembered that a valid notice to quit does not mean obtaining possession for the tenant can remain on as a statutory tenant unless under section 4 of the Rent Act, 1923, grounds for obtaining possession can be shown.

SHEFFIELD.—For the reconstruction and widening of bridge over the canal at Staniforth-road:—

*Messrs. Wellerman Bros., Sheffield £7,115

SHEFFIELD.—For the construction of reinforced concrete bridge over the River Sheaf, at Charlotte-road:—

*Messrs. Thos. Wilkinson & Sons, Ltd. Sheffield £6,100

SHEFFIELD.—For the construction of reinforced concrete bridge over the River Sheaf, at Rydal-road:—

*Messrs. A. Waddington & Son, Sheffield £4,194

SOUTH QUEENSFERRY.—For erection of 20 houses at Hopetoun-road, for the T.C. Mr. W. M. Scott, architect, Linlithgow:—

Brickwork—
*D. Aitken, Bo'ness £2,654 3 9

Joiner—
*P. Doherty, Queensferry 1,683 14 7

Slater—
*J. Robertson & Son, Dunfermline 477 9 9

Plaster—
*G. M. Paris, Broxburn 563 1 5

Plumber—
*A. Thomson & Co., Dunfermline 717 10 7

Glazier—
*Dickson & Walker, Edinburgh 34 2 9

SOUTH SHIELDS.—Concreting in back Alnwick road, for the T.C.:—

*George Thornton & Co. £508 12

SOUTH SHIELDS.—For 64 privy conversions in Alnwick-road, and Ebor, Tennant and Medres-streets, for the T.C.:—

*A. Holmes & Co.: 30 at £5 17s. 6d. and 34 at £6 10s. each.

STONE.—For carrying out w.c. conversion scheme for the U.D.C.:—

Section 1 (Newcastle-road, Newcastle-street, and Margaret-street)—	
*F. W. Loxley	£394 1 9
Section 2 (North-street, Station road, and Alma-street)—	
*J. Marson	339 18 10
Section 3 (High-street and Mill-street)—	
*G. H. Davenport, Wolstanton	663 0 0
Section 4 (Stafford-street, Crown-street, and Abbey-street)—	
*Yates & Francis	585 11 1

STAFFORD.—For kerbing, channelling and paving footways in Gaol-road, Marston-road, Earl-street, Bath-street, Albion-place, and Chapel-str: for the T.C.:—

*G. Sandy & Co. £2 24 13 9

STRETFORD.—For interior decoration in water paint or wall paper of two rooms in each of the 416 houses of the U.D.C.:—

	Each on schedule of prices.
*T. W. Bagley	158 houses.
*J. Hartland	137 houses.
*T. Summers	71 houses.
*H. Storer	50 houses.

SUNBURY-ON-THAMES.—For erection of 20 houses, for the U.D.C. Mr. H. F. Coales, Surveyor, Council Offices, Sunbury-on-Thames:—

The Pioneer Works, Ltd., Hammersmith	£11,800
W. G. Tarrant, Ltd., Byfleet	10,660
F. D. Hidden & Co., Ltd. Brentford	9,297
Collinson & Co., Ltd., Teddington	9,200
Lucas Bros. (Shepperton), Ltd., Shepperton	9,100
Newby Bros., Southgate	8,750
Edward Wright, Sunbury	8,740
F. Hopkinson & Co., Ltd., Worksop	8,200
*W. A. Annett, Walton-on-Thames	8,000

SUNBURY-ON-THAMES.—For construction of cast-iron and glazed stoneware pipe sewers, for the U.D.C. Mr. H. F. Coales, Surveyor, Council Offices, Sunbury-on-Thames :—

Wimpey & Co., Hammersmith	£4,474
S. Kavanagh & Co., Surbiton Hill	4,304
Mowlem & Co., Westminster	4,159
Standard Construction Co., Swansea	3,542
Crawford Bros., Havant	3,295
Gunn, MacNeill & Co., London	3,520
*Langley & Johnson, Slough	3,470

TRALEE.—For the erection of 14 dwellings at Tralee, for the U.D.C. :—

*Coughlan Bros., Cork £630

TUAM.—For rebuilding Town Hall, for the Town Commissioners :—

Charles Doyle, Mullingar	£5,553 7 6
W. Simmons, Galway	5,157 11 6
P. Dooley, Galway	5,086 16 3
Thomas Coughlan, Castlepollard	4,812 17 10
Martin Burke, Tuam	4,607 13 0
Thomas McHugh, Tuam	4,598 11 11
James Stewart, Galway	4,484 7 6
*Owen Larkin, Ballinasloe	4,130 1 4

(Accepted subject to modifications in the design.)

WAKEFIELD.—For erection of two houses in Park Lodge-lane, for Messrs. Massie & Holdsworth :—

Mason—J. Lockey.
Joiner—E. Lockey.
Plasterer—W. H. Moss.
Slater—H. & W. Parker.
Plumber—Ellis & Longbottom.
Painter—N. Keighley.
(All of Wakefield.)

WAKEFIELD.—For erection of two houses in Belgrave-mount, for Messrs. Massie & Holdsworth :—

Mason—Furness & Render.
Joiner—Broadhead & Son.
Plasterer—T. E. Senior.
Slater—H. & W. Parker.
Plumber—J. Woodhead.
Painter—J. Broadbent & Sons.
(All of Wakefield.)

WALLASEY.—For the erection of boiler house extensions, &c., at Generating Station, Poulton, for the T.C. :—

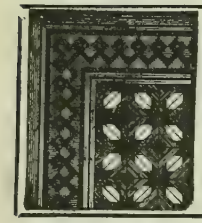
*J. & G. Chappell, Liverpool £14,700

WALLASEY.—Six chalets and three kiosks, for the T.C. :—

*Kent & Co., Liverpool £339

WALLASEY.—For making up streets, for the T.C. :—

*John McGeoch & Sons, Wallasey—
Lindeth-avenue £541 19 4



WEYMOUTH.—For alterations to the ladies' cloak room, Alexander-gardens, for the T.C. :—

Jesty & Baker	£257
Theo. Conway, Ltd.	250
Bird & Cox, Ltd.	240
*Jenkins, Hitt & Grant, Ltd.	216

New Thames Frontage.

In the course of a letter to *The Times*, Mr. Alan E. Munby states, in reference to the controversy on the Thames bridges, that the Thames between Westminster and Blackfriars is much wider than for some distance on either side—at Waterloo Bridge, for example, it is about half as wide again as at Southwark Bridge. The area at low tide between Waterloo and Blackfriars Bridges appears to be nearly fifty acres, and that between Waterloo and Westminster Bridges rather more, say, together, 100 acres, which approximates to the area bounded by Cannon-street, Bishopsgate, London-wall, and Aldersgate and St. Paul's. At high tide, this river area is possibly 20 per cent. more. No suggestion should be countenanced which would spoil the vista of the river or the possibilities of a fine architectural scheme which new bridges invite; but were a section of the river floored over near the southern shore, an opportunity would exist for the creation of a fine frontage, to which one or more bridges of less span, and, hence of less cost could be attached, and very valuable ground rents would be created without the interminable process of acquiring existing interests.

If this suggestion should prove on investigation to be impracticable, he makes a plea for moving footways over any new bridges. Distance, he continues, is measured by time, not by space, and such footways, practicable perhaps alone on bridges, arranged with speeds at each end to admit of good central velocity, would greatly increase the handling power for foot traffic, reduce vehicle traffic, and add to the value of property on the southern shore considerably.

THE BUILDER

A JOURNAL FOR THE ARCHITECT AND CONSTRUCTOR.

WITH WHICH IS INCORPORATED "THE BRITISH ARCHITECT."

VOL. CXXVI.—No. 4233. MARCH 21, 1924.

THE ARCHITECTURE OF SHOPS: A MODERN SYMPOSIUM.

THE question of advertising has come very much before the public lately, and the occasion is a suitable one to refer to the problem of the shop-front. Until the beginning of the last decade it could safely be said that architects made no serious efforts to deal with the shop-front problem in a logical and sympathetic manner. It would be truer, perhaps, to say that many architects ignored the shop-front, and refused to have anything to do with its design. The subject was distasteful, and it became a question whether the shopkeeper should be helped and encouraged in a development which seemed to have nothing to commend it. The arguments of the architect were sound, and it could be contended that if we had fewer acres of plate glass we should still be able to buy what we wanted. The counter argument was that the large window tempted the public to buy what it did not need. At all events, the general tendency everywhere was to secure the maximum area of window space, and though the advertisement value of the huge window was always doubtful, there was never any ambiguity about the disastrous effects upon the architecture. The following imaginary criticism was quite typical of the period, and might well have applied to many buildings: "This building takes its place as a fine example of modern commercial architecture. If we regard it as a design from the first floor upwards it is excellent, *sui generis*. Unfortunately, the huge expanse of shop-fronts makes any form of architectural composition impossible, and we should have thought that the owners would have been willing to sacrifice immediate profits for the gain in architectural dignity, by either abandoning the shops or confining the windows to smaller dimensions."

Mr. Max Beerbohm's delightful essay on "Signboards" appeals to the architectural mind, which was always fully aware of the commercial value of dignity and reticence. He suggests a signboard to the shopkeeper to teach him to chasten his shop window. The shopkeeper objects; he considers that shop windows are attractive enough in themselves and have made these boards unnecessary: "You are wrong, believe me! Your window is quite repulsive. But the signboard, being itself an absolute symbol, will teach you how very well it is to symbolise, rather than to parade your wares. Are you a jeweller? You fill your window with a garish and unseemly chaos of all you have: bracelets, sleeve-links, penknives, tiaras—*toute la boutique*. Your rival in Paris, even in New York, is much wiser. He understands the value of a reticent symbolism. Very little puts he into his window. What he puts is good. Men and women, beholding, praise it. Their imagination has been stirred, their appetite whetted for the things that are withheld, and they long to enter in at the door. Last winter, in the Rue de la Paix, I saw a jewel-window, sir, that should serve for an example to you. It was lined with scarlet velvet and illustrious with electric light. In the very middle of it lay, like a bomb in a palace, one beautiful black pearl. Had I been rich, I must have entered. Are you a florist? I blame you less for your profusion. For flowers, being things of Nature, do not need any artistic ordering, and your window, with its lilies and forget-me-nots and lilac-branches, is a chance patch of the country not unwelcome to us. Yet you, also, might expose but one single daffodil on some days. And as for the crude efforts of your neighbour, the butcher, to create a pastoral atmosphere, I cannot think of them but with utter contempt. Let him put up all his shutters and keep the dreadful secrets of the slaughter-house to himself."

This is an age when we are supposed to select our purchases from the shop window; an earlier generation expected the shop to contain the article in request. It may be that our needs and wants are not so clearly defined to-day, and we purchase something as a passing fancy which we happen to have seen in a shop window. Mr. Arnold Bennett, who is always modern, discusses "The Shops" in one of his illuminating essays. As an expression of the spirit of the age it is excellent, and it represents another point of view which the architect cannot afford to neglect:

"*The* shops count amongst the greatest attractions of London and the provincial cities. They draw to their windows enormously larger crowds than Westminster Abbey or the National Gallery. There are half a dozen spots in the West End where the spectacle of shop windows full of frocks, hats, and lingerie results in blocked pavements for several hours every day. No other kind of wares will regularly block pavements. And let it be admitted that no other kind of wares are so pretty and agreeable to look at, and therefore so worthy to block pavements. The richly variegated windows of a big shop, just illuminated at twilight, with the dark upper stories setting off their brightness, and the hypnotised crowds passing slowly in front of them, make a show that for truly romantic beauty cannot be beaten in London, and I will back it against any sunset seen from Westminster Bridge. Further, sunsets are not improving in elegance, and shop windows are."

The idea of the large modern shopping emporium brings us nearer in principle to the old fashioned shop, when obviously it is impossible to stock the windows with a sample of every commodity. The logical development of the emporium, therefore, seems to lead us to the conclusion that the need for a spectacular and prodigal display at the pavement level may not be so essential in the future. It is a mistake to look too far ahead in architectural matters, and commit ourselves to rigid arguments upon any phase of our civilisation. The modern emporium is not yet the final word of the trader, and in saying this we bear in mind that everyone is not convinced that the departmental system of shopping is the ideal. Mr. E. V. Lucas in "A Wanderer in London" regrets the passing of the old shops, and we are in sympathy with him. The saddest change, he says, in the shops of London is in the chemists: the greatest in the tobacconists: "An element of bustle has come into the chemist's life. Of old he was quiet and sympathetic and whispering: now his attitude is one best described by the words 'Next Please.' I wonder that the sealing wax remains. In some of the new chemists the difficulty is to find bottles at all. Only by struggling past novels and photograph frames can this be done."

The social attraction of the shop window is a factor which must be balanced against the architectural appearance of our streets. If we were certain that buildings on glass bases were the final expression of the shop, it is obvious, from a civic point of view, that the proper position for them would be in a quarter devoted to shopping alone. There is, however, ample evidence to show that the influence of architecture is beginning to have effect. A decade of steady progress in the design of the shop-front can be recorded, and the marked improvement is due to the fact that architects have accepted the problem and studied it seriously. The moral influence of the dignified window has demonstrated to the shopkeeper the æsthetic and commercial value of reticence in window dressing. Window spaces are being reduced by delicately designed marble or bronze surrounds which enhance the choiceness of the limited number of articles displayed. It is possible that we are in sight of the day when the shopkeeper will realise that the architecture of the shop-front is an attraction to the public, and that the smaller window serves his purpose better than a wilderness of plate-glass. From a recent article in the *Manchester Guardian* on "London Architecture" we quote the following:—

"One of the features of the year, indeed, has been the more expert consideration given to the shop-front. One feels that if the rebuilding of Regent-street were now only being considered, instead of being completed, we should have a prospect of a worthy successor of the polite old thoroughfare."

If we have diagnosed cause and effect correctly we can point a moral. It means that no commercial development should be neglected by architects because they happen to disagree with any particular tendency of the moment. We have come to understand that health in architecture, as in life, is best established, not by the avoidance of risks, but by being prepared to meet them. By dealing frankly with the daily problems which come to hand, the architect can make architecture a living thing, which, in the end, will not only survive all fashions, but will ultimately influence everything it comes in contact with.

NOTES.

The R.I.B.A. Meeting.

Major Barnes's paper on "National Housing" at the R.I.B.A., on Monday, attracted a gathering representative of almost every housing interest, and produced a most stimulating discussion. It was curious, however, that among all those speakers who discussed the pros and cons of national housing not one should have referred to p. 211 of Major Barnes's book, "There are others, including the writer, . . . who believe that such public provision is as a rule more expensive and less efficient, and is, therefore, a regrettable necessity only to be accepted if it is inevitable." How can it ever be necessary and inevitable to do something in an expensive and less efficient way unless the cheaper and more efficient way is not available? Major Barnes did not face this fact in his excellent paper, and to face it properly it would be necessary to prove not only that private enterprise is not available now, but that it can never be available again. Major Barnes is out for permanent State housing, which seems to us to be propping permanently the bad industries at the expense of those who can and do house their people properly and pay adequate wages. At the same time we should like to congratulate Major Barnes on an able and interesting paper.

Realisation of Competition Designs.

When we recall the history of architectural projects in Manchester, it is only natural to find some feeling of uncertainty in the minds of possible competitors for the proposed Art Gallery in that city. Mr. G. H. Willoughby very pertinently suggests that there should be "some reasonable agreement amongst the promoters of this scheme that the work will ultimately be proceeded with." Even the solatium which the R.I.B.A. competition conditions provide for the authors of winning designs which are not carried out does not form an adequate compensation, for it is the carrying out of his design in the completed building which is the real goal of an architect's ambition. In the multitude of counsellors we are told lies safety, but to the onlooker the multitude of counsellors in Manchester has appeared to spell confusion.

A National Style of Architecture.

In the course of the interesting address given by Lord Curzon at the opening of the second exhibition of the Architecture Club his lordship said the answer to the question as to whether they "were capable of producing any new national style of architecture" was doubtful—and this may well be the case. It is not in any conscious way that such a result will be reached and it is altogether to be doubted whether we should be aware of having reached it if we did. Of the good we are seldom conscious, and to set out to produce a new style of architecture might lead us very far astray. It is better to have as our aim to do the best in the conditions presented to us, and to leave style to take care of itself.

Conduit Street.

As one looks up Conduit street, the effect of the new buildings on the farther side of Regent-street would not evoke any encouragement to our hopes for better ideas of balance and dignity in our newly fronted thoroughfares. The two new buildings, separated by a narrow street way, are so different in scale as to produce a very unfortunate result. Another note on recent street effects may be found in the excellent decorative effect which balcony railings often produce, as illustrated by the newly-painted railings along the Waldorf Hotel front, the light green effect being very pleasing.

Approach to Waterloo Bridge.

The street widenings and other city improvements inevitably suggest opportunities that once lost can never be regained. It is not surprising then, that the opening up of the Strand approach to Waterloo Bridge indicates very graphically how our street congestion at points like this might be relieved. Mr. John Struthers writes: "At present there is no opening to the Embankment for heavy fast vehicles, for the vast amount of traffic converging at the point referred to in the busiest thoroughfare of the Metropolis, between Northumberland-avenue in the west to New Bridge-street in the east, a distance of nearly a mile-and-a-quarter. It would, therefore, be an improvement of the first magnitude were relief provided as proposed by the formation of the new spur street, already suggested. The gradient might not be quite of the requisite character, but with expert drafting it is believed the route might be so arranged as to afford access between the points of a satisfactory nature, especially if the whole area were set out for improvement, between the Savoy Hotel and Wellington-street, and between the Strand and the Embankment. If that area were scheduled, a further traffic improvement might be considered in the matter of another by-pass between the Strand opposite Burleigh-street and Wellington-street. That site in the Strand is now vacant also (and for sale), and the remaining property on the south side of the street eastwards set out for demolition and a widening. The two spurs might, therefore, be planned in conjunction with the happiest results, as far as the nature of the topography of the area will allow, were the whole 'squared' area as suggested made available for re-planning. While the matter is under consideration, a third question calls for attention. It concerns

The Eagle Gate, Salt Lake City.

the systematisation of the traffic converging from all the points of the compass on the main thoroughfare at the approach to Waterloo Bridge. I am an advocate of the 'one-way-traffic points,' and believe that it might be possible to form a 'squared-circus' for traffic regulation there, the whole work being taken as a single improvement, capable of great development."

Kensington Square.

It is very satisfactory to know that an agreement has been reached under which the prominent commercial firm who owned two houses on the north side of Kensington-square have agreed to leave these houses unchanged in character for thirty years. By an arrangement with the owners of three houses on the north side of the square, the firm in question have purchased a portion of the gardens at the back of them, the owners having sold these gardens through a public-spirited desire to preserve the amenities of this historically and architecturally interesting spot. Mr. Bryan Fell, who gives an interesting account of these arrangements in a letter to *The Times*, adds particulars of a covenant which other owners of houses in the square have entered into, in order to preserve the site from further encroachments. Mr. Fell points out with much truth that "commercial values are not the only values, nor should they be allowed to override over considerations of equal or greater importance." It is here, in fact, that our values are most wrong. Business and commercial interests ought not to be allowed to imperil the security of those permanent values with which time and historical associations have invested many parts of London, nor the quiet of those who seek to enjoy and retain them.

Private Munificence.

Those public-spirited people who endow prizes and awards would serve the cause they are supporting more generously if they would repose greater faith in the discretion of administering bodies. A benefactor may naturally wish to encourage the study of a particular subject, but he is defeating his own object, as well as straining the privileges of patronage, if he restricts the trustees of the endowment to permanent rigid conditions. The principle of limited perpetuity ought to apply to scholarships and awards, and after, say, the formal 33 years of a generation, the trustees should be empowered to modify the conditions, in the spirit of the gift, for the good of the body they serve. The controversy over the Rome Prize is an instance of altered conditions and demands in architectural training, and indeed one has only to glance down the list of awards by "private munificence and held in trust by the Royal Institute" to realise the inequalities. Devolution in training and the establishment of local centres have only added to the complexity, but the intention of the benefactors would be more accurately translated if greater discretion were allowed in the interpretation.

Our Dorothy Perkins.

A correspondent writes:—"It has been suggested that owners of little adjoining gardens, spread out like so many bandana handkerchiefs around our surburban terraces, should encourage the communal movement, forgo their barriers, and throw their plots into one large satisfactory garden. It sounds plausible, but if the reaction against ostentatious individualism is carried too far it will defeat its own end. Harmony means a contribution of differences, and we can surely remain neighbourly without having our personality battered out by experts. An expert would certainly give us more beautiful gardens, and probably some vegetables thrown in, but we don't want this. We want our own plot and our own Dorothy Perkins, and we value our own fence more than anything else we have."

Architecture Club Exhibition.

Carved Oak Woodwork at St. John's Church, Lattingtown, U.S.A.

Sir Robert Lorimer, A.R.A., Architect.

GENERAL NEWS

Professional Announcement.

Mr. C. Gordon Huntley, A.M.I.E.E., and Mr. William W. Wood, A.R.I.B.A., of the firm of Huntley & Wood, consulting engineers, P. & O. House, Cockspur-street, London, S.W. 1, dissolved partnership, by common consent, on February 16, 1924. Mr. Wood is now winding up the practice from 3, High-street, Spalding, Lincs.

Tenders for Checking Prices.

The Administrative Committee of the Southern Counties Federation of Building Trades Employers draw our attention to "the growing method of co-operative societies of obtaining prices from a number of builders for contemplated building works, with a view apparently of seeing if the prices supplied by their own Building Departments are fair and reasonable, or, in other words, using the time of the builders in preparing and submitting estimates without, so it would appear, the least intention of giving the work to a builder, free of cost to themselves. . . ." To invite tenders with such intentions, they add, is to ignore ordinary business ethics, and is an injustice to the contractor.

Mr. J. H. Thomas.

Mr. J. H. Thomas, the Colonial Secretary, has resigned his post as President of the Co-operative Permanent Building Society.

Ancient Architecture.

Mr. D. S. Robertson lectured recently on this subject at Westminster School, at a meeting arranged by the Society for the Promotion of Hellenic Studies.

In the course of his remarks, he dealt with the temples of Greece from the seventh century B.C., and said the palaces had perished, but the temples, or many of them, survived, having been turned into Christian churches, thereby becoming sacred. He emphasised their simplicity, their general plan resembling that of an English barn. Doric and Ionic were the two great styles, and Doric predominated throughout, though Ionic became popular at Athens. The chief feature was the porch at the East End, but he pointed out that the Temple of Zeus at Olympia had a sham porch at the back, with no door in the west wall, while the Parthenon had a genuine porch at each end, this, in fact, being a double temple. It was impossible to estimate the influence of ancient architecture on the modern world, but all the buildings of the Middle Ages had their foundation in the architecture of Greece and Rome.

Holding-Up Empty Houses.

The Minister of Health, the Rt. Hon. John Wheatley, M.P., received recently a deputation from the Birmingham Town Council, including the Lord Mayor and the Chairmen of the Finance and Housing Committees. The deputation urged that some means should be found for preventing the holding-up of empty houses for sale, either by charging the owners with rates even when they were empty, or by giving the local authority further powers to take them over compulsorily by purchase or lease. The Minister replied that he had every sympathy with the object in view, but he was afraid that at any rate as far as the rating proposals were concerned, it was unattainable, as it would require legislation of an important and contentious nature which there would be no chance of getting through this year. There were also difficulties in the way of giving local authorities the suggested powers outside the rating proposals in regard to empty houses—amongst other reasons because of the difficulty of deciding whether houses were being legitimately kept empty or not. He promised to consider any suggestions that were made to him.

"Our Contemporary Sculptors."

The description (in our last issue, p. 410) of Mr. Gilbert Bayes' work entitled "Peace" should have been: "A Bronze Figure from the Water Priory Memorial." The relief at the Children's House and the coloured garden figure were fired and glazed by Messrs. Doulton & Co.

COMPETITION NEWS

Sheffield War Memorial.

The assessor (Mr. E. Vincent Harris) has made the following awards in this competition

(1) Mr. Carus Wilson (given in the last issue of *The Builder*), Lecturer in Architecture Sheffield University.

(2) Messrs. G. J. Morewood & G. C. P Toothill, Sheffield.

(3) Messrs. F. Jahn & R. Smith, Sheffield Technical School of Art.

Newcastle Concert Hall.

The assessor, Mr. A. W. S. Cross, F.R.I.B.A. has made the following awards in this competition:

1. (£750) Messrs. Nicholas & Dixon-Spain FF.R.I.B.A., London, W. 1.

2. (£250) Messrs. Adshead, F.R.I.B.A., Topham, A.R.I.B.A., & Adshead, A.R.I.B.A. Manchester, and Mr. W. H. Wood, F.R.I.B.A. Newcastle-on-Tyne.

3. (£100) Captain H. T. Wright, F.R.I.B.A. 13, Brunswick Place, Newcastle-on-Tyne.

New Masonic Temple.

The Bradford Masonic Association invite designs and estimates for a Masonic Temple to be erected at Bradford. Premiums of £200 £150, and £100 will be awarded to the first second and third premiated designs. A committee appointed by the Association will act as assessors. Sending-in day, June 30. Plans and conditions can be seen at the office of *The Builder*.

Other Competitions.

Other competitions still open include the following (the dates given are, first the sending in date, and second the issue of *The Builder* in which full particulars were given):—Essay on Heating and Ventilating (Mar. 31 Nov. 9, 1923). Industrial Designs (June Dec. 21, 1923). National Theatre (April 26 Monument to Sir Wilfrid Laurier (April 3 Dec. 14, 1923). Newcastle Fire and Police Station (March 27; March 14). Ross-Smith Memorial (Sept. 30; Feb. 1).

Architecture Club Exhibition.

Chimneys at Winchendon Priory.

Mr. Philip Tilden, Architect.

CONCERT HALL AND BATHS COMPETITION, NEWCASTLE-ON-TYNE

A Criticism by a Competitor.

Having myself spent the better part of four months on this problem, I may at least claim to know something about it, and my remarks may be of interest to my fellow-competitors.

At the outset, I should like to express my appreciation of the painstaking care and endless trouble (obvious to anyone who has seen his report) taken by the assessor, Mr. A. W. S. Cross. However many mistakes we may have made, and there is not one design in the room which is free from them, Mr. Cross points to them in a kindly spirit, and so helps us all on our way.

There was one mistake—and one only—in the conditions issued to competitors. That was the reference to, and description of, the scheme prepared by the City Property Surveyor, however excellent that scheme may have been. Many of us allowed it to tie our hands—a most unwise thing to do in any trial of skill—and most of all in an architectural problem of great difficulty. About seventy-seven applied for particulars and parted with two guineas for an indefinite period, a practice which I think might well be discontinued; and forty-one designs were received. That means that thirty-six were floored by the problem of putting all the buildings asked for on a site which could easily have been extended. It is even rumoured that negotiations are in progress for this extension of the site, which makes us all look a little foolish.

Design No. 20, by Messrs. Nicholas & Dixon Spain, has undoubtedly the finest elevation in the room, and I fancy owes its place in no small degree to this. The plan has, perhaps, fewer mistakes than many others, but the slipper baths on the first floor butt into the ladies' bath hall in a reprehensible manner, very skilfully cloaked on the section, yet acknowledged by the figured heights. I have rather a preference for stairs on an outside wall myself. Particularly clever is the handling of the two corridors flanking the men's bath hall, enabling the galleries to be set well back from the edge of the pond. This was a stumbling-block to many of us.

I also admire the daring manner in which the authors elected to place their engineering plant under the concert hall, and away from the baths, and the successful way in which they have done it. This was, in my opinion, the crux of the problem, but I feared this solution myself, quite wrongly it appears. I congratulate the winners most heartily.

No. 17.—Messrs. Adshead, Topham & Adshead, Manchester; and Mr. W. H. Wood, Newcastle-upon-Tyne. This is also a design which owes its place in no small degree to an excellent elevation. The crush halls are small, service for towels is through the ladies' bath hall, cloak rooms are totally inadequate. But the general lines of the plan are in some respects superior to the winners, and the whole scheme is excellent in its simplicity, a quality sadly lacking in the majority of the designs. This design was placed second by the assessor, and is well worthy of its place, except for quite inadequate exits.

No. 22.—Mr. J. H. Kennard, London. Quite one of the best plans in the room, with an excellent concert hall, fatally spoiled by insufficient exits, which could quite well have been provided. It fails in elevation and by putting the ladies' bath hall (to be used as hall) on the basement floor. But for these faults, this scheme would probably have gone a long way.

No. 33.—Messrs. Marshall & Tweedy, Newcastle-upon-Tyne, show a very well planned concert hall on ground floor, which fails on the first floor, being too cut up and strained, lacking the simplicity I have referred to. Another fatal error is insufficient exits. Badly balanced front elevation, that to College-road being much the best. They have a beautifully rendered detail, showing an excellently designed facade, spoiled by the grouping of the front generally.

No. 32.—Mr. Joseph Hill, London, submits one of the finest ½ in. scale details in this collection, the Doric Order very simply and effectively treated and really beautifully ordered. The elevations fail for lack of a central feature. The lighting of his Turkish bath is deficient.

No. 37.—Messrs. Willink & Dodd. The best planned Turkish bath submitted in this competition. The elevations would be much better without the two wing porticoes, thus giving emphasis to their central feature, exquisitely shown on a masterly ½ in. detail.

No. 5.—Mr. T. Braddock, London, S.W., has very well balanced elevations, excellently drawn. The plan shows a fan-shaped concert hall, with a gallery projecting 45 ft. into the auditorium, much more than half the depth of the hall. This scheme fails in section, and the Green Room is much too small. The entrance hall and cloak rooms are very good.

No. 14.—Messrs. Mauchlen & Weightman, Newcastle-upon-Tyne. A well-planned concert hall, with really adequate entrance hall and cloak rooms, &c. This scheme well deserves the special commendation given to it by the assessor, and I think this firm should do well in competitions, as they appear to grasp the essentials of a problem.

I have only mentioned a few of the designs, many of them very able and well worth close study.

MEETINGS

Friday, March 21.

Edinburgh Architectural Association.—Professor Beresford Pite on "The Tendencies of Architectural Education." At 8 p.m.

Illuminating Engineering Society.—Discussions on "The Use of Light for Outdoor Advertisements" and "The Use of Light in Shops and for Display Purposes." At Royal Society of Arts, John-street, Adelphi. At 8 p.m.

Saturday, *March* 22.

Institute of Certified Carpenters.—Dinner. At Pritchard's Restaurant, Oxford-street, W.1. At 7 p.m.

Monday, *March* 24.

Architectural Association.—Miss Margaret Jourdain on "The Architect as Designer of Furniture." At 35, Bedford-square, W.C.2. At 7 p.m.

Tuesday, *March* 25.

Architects & Surveyors' Assistants Professional Union.—Visit to showrooms of the National Radiator Company. At 439, Oxford-street, W.1. 7 p.m.

Wednesday, *March* 26.

British Society of Master Glass Painters.—Dr. T. M. Legge on "Specimens of Fifteenth-Century Stained Glass," and also Mr. F. S. Eden on "Ancient Stained Glass in London." At 6, Queen-square, W.C.1. 5.30 p.m.

L.C.C. Central School of Arts and Crafts.—Sir Banister Fletcher on "Byzantine Architecture, A.D. 324 Onwards." At Southampton-row, W.C.2. 6 p.m.

NORTHERN ARCHITECTURAL ASSOCIATION.

The annual exhibition of drawings by members of the Northern Architectural Association was held at Higham Place, Newcastle, recently. The drawings of Cairo Hospital, by Messrs. Cackett & Burns Dick, of Newcastle, and Messrs. W. & T. R. Milburn, of Sunderland, were on exhibition. These two firms were in the final list of six competitors. Competitive designs in other schemes were on view. Messrs. Hicks & Charlewood, of Newcastle, showed designs which secured second prize in the War Memorial Chapel Competition, Durham. Mr. Marcus K. Glass, of Newcastle, also had an exhibition of drawings.

THE LONDON SOCIETY

A CLEANER LONDON.

The annual meeting of the London Society was held recently at the Royal Academy of Arts. Lord Crawford presided.

The report deals with the Society's activities in regard to the proposed demolition of the City Churches, St. Paul's Bridge scheme, and the idea of a bridge at Charing Cross. With reference to the Central London plan, the report stated that as a preliminary to such a plan, it was necessary to prepare existing user zoning maps for the various boroughs, and the architectural staff had now completed those maps for two-thirds of the Metropolitan boroughs north of the Thames. The term "existing user zoning" was a little technical, and meant that those maps showed the present uses of the various properties—namely, residences, shops, factories, industries—as it was necessary to know how industries were placed, which areas were most suitable for dwellings, and so on, before laying down a new plan for London of the future.

Lord Crawford said that any movement of an æsthetic character well established in London would carry its influence and impetus throughout the country. A great responsibility rested on the executive committee of that society, for there was plenty of scope for good work in London. The report made two concrete suggestions in regard to the City Churches:—(1) That a public meeting should be held on the subject; and (2) that the Society should take steps to extend to the area upon which a church stood the restrictive covenants which already protected the churchyards.

Sir Aston Webb, P.R.A., in the course of his remarks, said the Society had been doing constructive work from the first. The first constructive work they did was the preparation of a plan showing the possible arterial roads out of London. It was completed by the end of the war, and had proved extremely useful to those whose duty it had been to carry out road work and give employment. Since the London Society was founded civic societies had been formed in most of the cities and towns of England.

It seemed to Sir Aston that there were three things which London wanted very badly and in which the Society could help. First of all they wanted a clean London—that was, a smokeless London—and he believed it was attainable if they all tried to secure it. One committee on smoke had lately reported that one-quarter of the smoke of London came from factories and three-quarters from domestic fire grates, so that the citizens generally were responsible for much of London's smoke. The only remedy was to encourage the inquiry into the production of smokeless fuel at the same price as, or a little cheaper than, that of soft bituminous coal. Then the use of the latter fuel should be prohibited in large towns like London, Sheffield, Birmingham, and Manchester. The second thing which badly needed improvement was the traffic government of London, which was now in a hopeless condition. A central authority was needed for the main services of London, with the power to decide on the direction and course of roads and tramways, instead of the problems being confused by the interests of many authorities.

Third: there was urgently needed a great development plan of London—or rather, two plans, supplementary in character, were needed. There was the zoning of London, showing at a glance the grouping of industries, dwellings, and the use made of dwellings, and this should form one plan. This would show what a haphazard mixture London was now, and might enable it to be straightened out by degrees. Besides they needed an imaginative map of London as it might be, and in the future they might begin to work towards a simplification of London and at the same time add to its beauty

Victoria National War Memorial Competition. Design placed Second: By Mr. William Lucas.
[Miss Margaret Baskerville and Messrs. C. Douglas Richardson and W. P. McIntosh, sculptors; Mr. M. Napier Waller, painter.]

Lord Lister War Memorial. The late Sir Thomas Brock, R.A., Sculptor.
[This memorial was unveiled in London by Sir John Bland-Sutton, to the memory of the late Lord Lister. It was designed by the late Sir Thomas Brock, R.A., who was commissioned to prepare the design previous to the war, which caused its postponement. His death intervening, the work has been carried out by The Morris Art Bronze Foundry, Rochester-row, Westminster.]

THE RIDDLE OF BIRCHINGTON CHURCH

By The late W. DE GRAY BIRCH.

Of the vast number of excursionists who daily rush along the high street of Birchington, a picturesque village on the northern coast of Kent, lying between Margate and Herne, very few condescend to linger for a few moments' exploration of the remarkable points of interest which the ancient church, dedicated to All Saints, offers to cognoscenti and antiquaries. Its weather-beaten tower and elegant spire, roofed with shingles of time-defying oak, present a landmark to mariners on the North Sea passing to and from London, in acknowledgment of which benefit the authorities of the Trinity House gratefully subscribed with no mean hand towards their repair.

The churchyard contains a large number of old tombstones, of which many of the most ancient inscriptions, seventeenth century and possibly earlier, have become illegible, and a considerable number of the memorials are sinking rapidly into the soil. Their artistic merits—for even in memorials of the dead there is, and always has been, a *cultus*—here consist for the most part of impossible cherubs, distorted skulls, unnatural foliage and flowers, and the usual concomitant panoply of the grave. Among them, almost the newest of them all, the modern cross put up in memory of Gabriel Charles Dante Rossetti, stands close to the south door, a so-called "Runic" cross, but sculptured without regard to the true proportions of crosses of that remote age, and ornamented, if we may indeed use the word here, with travesties of imperfect knot-work and spirals which would have excited horror in the eyes of the late J. Romilly Allen, as greatly as they perturb the mind of his disciples. But we must not complain when we read in the *Guide* to the church that this monument is a perpetration of "one of those brilliant lights of the pre-Raphaelite school, Rossetti's fellow-painter, Ford Madox Brown." The fabric of the church is well preserved and, in spite of copious *soi-disant* restoration, still exhibits many of its more ancient features. It is somewhat alarming to read that "the *last* restoration in 1863 was very thorough and cost as much as £981. It was carried out from the designs and under the superintendence of Mr. C. N. Beazley. . . . The gallery at the west end was taken down, the old pews removed, the side arches in the chapels opened up, the whitewash scraped off the walls and pillars, and the whole of the interior was restored." Restored indeed, but with the scraping and removals went away also the soul of the temple and the church is now naught but a "whited sepulchre" robbed of its past memories, if any linger there still.

If we examine the detail of the architecture, we see here, as in many other places, points which testify to the gradual replacements of old features by substitution of newer forms, the fashion of the ever-changing taste of the time; the Norman arches opposite the south door, and on the wall of south aisle, the early arches of the north and south chapels, the more sharply pointed arches of the nave and aisles, each and all indicate successive stages in the building of the fabric. The body of the edifice is roomy, consisting of nave, two aisles, three chancels, with fine arches of Early English work, springing from octagonal columns of simple design, that mark the area of the nave. The dimensions have been given as 94 by 24 ft., but the latter figure falls far short of the true breadth which is more likely twice as wide or even wider.

One peculiar feature is the tower, which here stands at the east end. Barrett, the historian of Birchington, assumes that this tower was originally constructed as "a squat tower" for one bell, at the time the chapels were built. Some persons have supposed that the nave and the aisle of this church belonged to a church at Gore End or Minnis Bay, and that to save it from the encroachment of the sea it was taken down and many of its stones utilised in the work of building the body of this one. Their theory rests upon the curious and puzzling dimensions and mouldings of an extra-wide column in the south aisle, with an unfinished or fragmentary arch now represented by the springers alone as they start from the shaft of the column, and supposed to have formed part of the supporting masonry of the earlier edifice at Minnis. Another theory is that the original design for the construction of the tower on one of the more westerly bays of the South aisle was found to be too expensive and had to be abandoned for lack of funds; nevertheless, there is among the evidences belonging to this church an old map on which is marked a small church at Gore End now no longer in existence. It is a riddle which an expert architect alone can solve. One historian states that "Gore End in this parish antiently had a church standing at the seaside, but the decay of the cliff near thereunto ruinated the same, and forced the inhabitants to build the church now standing, which was called 'All Saints.'"

The font is ancient and may have come from an older church. It is octagonal in form, and bears indistinct traces of sculpture on the facets. The oaken pulpit probably dates from 1675. There are old books and MSS., some of the sixteenth century, in keeping of the Vicar and Churchwardens, and there are many brasses memorialising the Quex and Crispe families, one also of "Sir" John Heynys, Vicar of Monkton in 1505, to which parish Birchington was a chapel annexed, dating October 9, 1523. In this brass, which is now let into the chancel wall, the Vicar is represented in embroidered sacerdotal vestments and holding up the chalice wherein is placed the hostial wafer, not the paten, as the *Guide* states. It is a valuable and reliable evidence of the ecclesiastical robing of the period. The carved tomb erected to the memory of Sir Henry Crispe and his lady in the N.E. chapel, and many other sepulchral art-relics make this church a rich field for the study of mediæval costume. Some of the brasses taken from this church have found their way, we fear, to the marine-store dealer and old metal merchant. The parochial register is one of the oldest in existence, dating from the first year of the Royal commands for keeping such records, 1538.

The original charm of this interesting church is greatly marred by the incongruous introduction of gaudy windows, bad in drawing, mawkish in conception, and false to fact. Why is it that in the great majority of church windows large sums are being constantly expended upon such monstrosities, popularly called stained glass windows? It is true that Albert Durer was guilty of anachronism when he delineated the faithful who assisted at the "Descent from the Cross" in headgear of his own period; it was the fashion of his time, and Holman Hunt's Christ at the Door is draped in vestures unlike anything Our Lord ever wore; but then, Durer and Hunt, not to mention numberless other artists, had not the opportunity of learning from the investigations of the Palestine Exploration Society the correct form of the costume of Christ's period. Nor had the miniaturists of the Middle Ages any opportunity of deriving inspiration from the early Greek Manuscripts or the Catacombs. But there is no excuse for our modern artists for following such inartistic examples that were then produced. A far less outlay would suffice to reproduce the beautifully designed and coloured stained glass of the twelfth century in Canterbury Cathedral, or the examples at Great Malvern; Evesham; Trinity College, Cambridge; St. Margaret's, Westminster; and many other well-known specimens of later dates, than is constantly being paid for kaleidoscopic freaks, and rainbow impossibilities which suggest to the right-minded ecclesiologist that the window-artist was suffering from a severe attack of *cauchemar*, and had temporarily thrown aside all the results of his education and observation.

No one, nowadays, would think of depicting Julius Cæsar landing in Britain clad in the uniform of the Duke of Wellington at Waterloo, yet we are asked to gaze upon the representation of sacred personages and incidents put before us not only absolutely inaccurate but totally regardless of what is now known to be the right way of depicting them. Take, for example, the Rossetti window at Birchington, with its "blind puppies" and its pudding-basin or "bowl of blood"; how much more beautifully remindful of Rossetti, poet and painter, would not a purely white-draped Genius of Poetry, attended by a Muse of Painting holding her appropriate emblem, set in a border copied from an early Canterbury window, have been, than the far-fetched and obscure suggestions conveyed in this church, as we are told in the *Guide*, "to the admiration of thousands of visitors"?

We regret to announce the death of Dr. de Gray Birch, LL.D., F.S.A., on March 8. at Monte Carlo, at the age of 82.

Dr. Birch was born on January 1, 1842, and from Charterhouse he went to Trinity, Cambridge, and at the age of 22 entered the MSS. Department in the British Museum. In 1865 he was made senior assistant, a post which he held till his retirement in 1902, after 38 years' service.

At the Museum Dr. Birch was occupied with the study and arrangement of MSS. charters and seals, and made a special study of Anglo-Saxon, Mediæval Latin, Portuguese, and Spanish. In matters relating to literary and record research, printing, book-binding, and disputed handwriting he became an acknowledged expert. Dr. Birch edited the Journal of the British Archæological Association, of which he was successively hon. secretary, treasurer, and vice-president, for 22 years. He also catalogued the seals in his department in six volumes, and wrote a history of Scottish seals; he edited the Royal Charters of the cities of London and Lincoln, the Cartularium Saxonicum, the Commentaries of Afonso d'Albuquerque, and the Nunnaminster MSS.; and he made a catalogue of Saxon Abbots and catalogues of the Margam and Penrice MSS. He also published histories of Margam and Neath Abbeys and "Memorials of the See and Cathedral of Llandaff," and an edition of the Register of Hyde Abbey, Winchester, as well as a history of Domesday Book. He was an honorary LL.D. of Glasgow University.

Mineral Resources and Architecture.

Mr. C. E. W. Bromehead read a paper recently before the Royal Geographical Society on this subject. He pointed out that in England the architectural style of a district was often controlled to a large extent by the material available locally. The dominant formation of the Thames Valley below the chalk gap was the London clay, which produced a soil in which oaks flourished. Therefore, in the absence of good stone, the builder turned to brick and timber, and the architect evolved the glorious Tudor mansions of red brick, or the humble, half-timbered crofters' cottages of Windsor Forest. The lecturer also mentioned the "black and white" buildings of Shrewsbury, which were world-famous. In sculpture the dependence of the art on the material available was well exemplified by the difference between that of Egypt and Greece. The fact that in England they had practically no true marble, and very little stone, suitable for fine sculpture was one reason why, with a single exception, there was no English school of sculpture of any importance. The public statues in London were notorious, and the exceptions proved the rule, concluded the lecturer.

A meeting of the Royal Institute of British Architects was held at 9, Conduit-street, W.1, on Monday last.

Obituary.

The Hon. Secretary (Mr. A. Keen) announced the death of Mr. William Henry Ward, M.A. Cantab., F.S.A., Elected Associate 1893 and Fellow 1919, Institute Silver Medallist (Measured Drawings, 1895); Mr. John Watson, of Edinburgh, elected Fellow in 1906; Mr. Walter Higginbottom, elected Fellow 1891; Mr. Thomas Edward Mundy, one of their oldest Associates, having been elected to that class in 1872; Mr. Edward J. Shrewsbury, elected Associate 1876.

It was decided that a message of sympathy and condolence be conveyed to their relatives.

NATIONAL HOUSING.

Major Harry Barnes, F.R.I.B.A., Vice-President of the R.I.B.A., then gave an address on "National Housing and a National Municipal House-building Service." In the course of his remarks he said the catholicity of the Royal Institute of British Architects was in no better way illustrated than in the freedom it gave to the expression of opinion, however heterodox, in respect of buildings—their height, their construction, their position, and in his case their provision. He would deal with the subject under the following headings:—

The Standard of Housing.

The town standard of public health was the first element in the cost of house building, and a not inconsiderable element. Roads and sewers as apart from land and buildings involved an addition to the cost of erecting a house under a housing scheme of sums from £50 to £60. He was fully aware of the problems that ranged round the construction of roads and sewers, but he hoped that those who took part in the discussion would not raise them. However interesting the by-way, the diversion would only detain them from their destination, which was the conclusion that the housing of the lower-paid workers must be undertaken as a public service.

The first proposition he offered for debate was: That, subject to wise economies in design and construction, adequate and well-constructed roads and sewers, with a sufficient water supply, were essential parts of a housing standard.

Up to the present in their history of this standard, the Englishman's castle was inviolate. The city engineer, the district surveyor, the medical officer, the sanitary inspector were all on the public side of the gate, and on the private side a man might still, despite the Act of 1667, do much as he liked with his own. Two standards had been set up. The first that not more than two people should occupy a room, and the second that for each person there should be provided 400 cubic ft. of space, from which they might easily deduce that a bedroom occupied by two persons, if it were 8 ft. in height, must have a floor area of 100 sq. ft. Presumably this capacity had been determined by physiological considerations, and at all events it was sufficiently well established as a standard. True, it was in fact the standard was not insisted on in existing buildings, and also that it was definitely proposed to reduce it during the present period of house shortage from 400 to 300 cubic ft., but he did not understand that any proposal had been made to reduce it in the construction of new buildings. Let it be observed that the regulation was not based on any sentimental consideration, but on the face that certain pulmonary and contagious diseases were regarded as arising from an insufficient supply of pure air.

Without further argument he would say: There must be a living room, and it must be adequate in size, and it must not be used as a wash-house or a storage-place for food or fuel, or so as to diminish the number of bedrooms that would otherwise be provided. There was another matter on which he would not dogmatise, and that was the addition of a parlour. From the point of view of convenience and comfort it seemed to be essential, but for his purpose, that of arriving at the irreducible standard, it was not, perhaps, a necessity. They could now sum those conclusions up in his second proposition, which he offered them for discussion, namely: That the housing standard demanded bedrooms of sufficient number to provide for the proper separation of the sexes, and of sufficient size to allow a minimum capacity of 400 cubic ft. per person in occupation of them, a living room of adequate size with food and fuel stores, and the separate and exclusive use of a scullery, washhouse, water-closet, and bathroom; or, in other words, that for the normal working-class family of parents and children of both sexes, the non-parlour house with three bedrooms was the minimum type of house that should be provided. The question of standard was absolutely crucial, and the discussion of housing apart from a conclusion on standard was the most futile of all futile proceedings.

The Cost of Housing.

They must recognise at the outset, the lecturer continued, that the standard he had outlined was something which had never been obtained. Before the war the better-paid skilled workers were getting something approaching it, but those below that grade were not getting it, and never had got it. The lower-paid worker, if he got a new house, which was rare, got one with much less accommodation than they were asking for, but in a vast number of cases he got no new house at all, but part only of one erected originally for a single family. Let them further recognise that they were asking for something better at a time when everything was dearer. These two things together meant that they had not merely doubled their difficulties, they had quadrupled them. Put in another way, they were proposing in the future to give the lower-paid worker a better house than the higher-paid worker had before the war. In cash that meant that for families which were housed before the war at 4s. to 5s. a week, a standard was desired which there was little prospect of providing at less than 15s. a week, a rent utterly beyond the rent-paying capacity of the lower-paid workers. They were, in the case of such workers, then, in the dilemma that they must either reduce the standard, increase their incomes, or provide them with houses of the standard irrespective of their rent-paying capacity. If they maintained the standard they abandoned private enterprise. If they clung to private enterprise they abandoned the standard. The housing standard and private enterprise were the two masters no man might serve, he must cleave to the one and despise the other.

Private enterprise worked on profit, and where there was no profit private enterprise would not work. Profit in house building was represented by the payment of remunerative rent; where there was no remunerative rent there was no profit, and where there was no profit there was no private enterprise. That had been the position since the war; and despite all the efforts made to obscure it, it became increasingly manifest.

The Addison scheme and the Chamberlain scheme both recognised the fact and made provision for it, by grants or guarantees.

It would appear they were in what was now fashionably called the vicious circle. Repeal the Rent Acts and they could get houses. Get houses and they could repeal the Rent Acts. Which way were they to run? The truth was that even in pre-war days the lower-paid workers were not housed by private enterprise up to any satisfactory standard, and that there was not the ghost of a chance of private enterprise providing for those workers in the future the higher standard which was now demanded. The housing of the lower-paid workers must increasingly become the task of municipal authorities. They were passing through a period of indecision and there was a reluctance to face the facts, but when once the municipalities were committed to an extended programme there would be no turning back. For good and all the housing of the lower-paid workers would have become as permanently a public service as their education. He would not pass to the question as to how the houses were to be provided by municipal action without again driving home his contention that, however much they might shy at establishing another great public service, it was either that or abandoning the housing standard that had grown up.

The Provision of Housing.

The first step was to dismiss entirely and for ever the idea that in their housing they had a task they could complete. Up to the present all housing programmes had been based on the idea that by a brief and intense application of collective activity, what was called the "shortage" could be made up, and then the task handed over to those of whom it was ignorantly said that they performed it before. He would, the lecturer said, dismiss in the most decisive manner such an idea: there was not only housing to be done to an unprecedented extent, of an unprecedented standard, but there was re-housing to do of an equally unprecedented amount. There were 8,000,000 houses in the country to-day. What life would they give them? If it were anything less than 80 years it meant that their replacements alone must be something more than 100,000 a year during that time. They must further increase that number of 8,000,000 by at least 120,000 a year if they were to provide for the new families that came into being, and they would then still have on their hands the problem of providing structurally separate dwellings for about 1,000,000 families for whom no such dwellings existed.

The next step was to dismiss with equal decisiveness the idea that this year, or next year, or the year after it would be possible to carry through a housing programme of 200,000 houses a year without a fatal inflation in costs right throughout the building industry. He gravely questioned whether the utmost sanity and vigour could do more than build up sufficient resources within this decade to enable them to start in the next, and maintain throughout it a steady output of 200,000 structurally separate dwellings in a year. The third step was to cut cottage building clean out of the main building industry (it was never really part of it), and half of the present trouble was that the two were entangled. It could not be too much emphasised that before the war, at the very outside, not more than one man in eight in the building industry was employed in cottage building, and it was questionable whether their output, including replacements, exceeded an average of 100,000 houses a year. The building industry had dwindled from eight men to four, and when it was proposed that instead of taking one man out of eight for cottage building they were to take two men out of four the proposition only needed to be stated to show them in what term of inflation it must express itself.

It was clear that if cottage building was to draw on the main building industry it could not have its extra man without inflating labour costs, until the whole building industry (particularly in view of the increase in maintenance and other constructional work) wa

recruited up to its full past strength and beyond. It was a moderate estimate that five men must come into the building industry before one additional man could be safely yielded to cottage building, and such wholesale recruiting was, it appeared, to be attempted. The building industry as a whole was to be made so attractive that it would furnish the requisite number for cottage building without leading to increased labour costs. It was an impossible task, that could not and would not be achieved, unless it was proposed to nationalise the whole industry. More than any other industry the building industry was exposed to the booms and slumps that accompanied the trade cycle. No industry in private hands was less capable of being stabilised. It was the last expenditure on which men engaged and the first from which they withdrew. It was subject to all the impediments that their land laws and their building regulations presented. The alternation of good times and bad times was a commonplace to all engaged in it, from the casual labourer who designed the building to the casual labourer who cleared away the rubbish at its completion. Let them make up their minds as to what it was they wanted to do. Were they out to stabilise employment or to provide houses? If the former, they might do something towards stabilising the building industry by employing it in times of depression on cottage building. For that purpose it was an intelligent enough proposition, and something might be achieved in the direction desired, but only at the price of destroying any regular programme, year in and year out, of cottage building. They could not have it both ways, they could not use their material to fill up the dips and depressions in their road and, at the same time, spread it evenly over their surface.

On those grounds, grounds not of theory but of fact, he submitted the only way to make cottage building possible was to make it a matter of municipal concern, and he advanced the proposition: That the public provision of dwellings for the lower-paid workers was inevitable, that it demanded a steady and little varying programme, and that the execution of such a programme without a general inflation of building costs could only be secured by the establishment of a national municipal cottage-building service apart from the main building industry.

A National Municipal Building Service.

The first task of such a service would be to organise independent supplies of labour and materials as far as possible unaffected by fluctuations in the main building industry. The labour task was to find 200,000 men and retain them for the specific purpose of cottage building, and his suggestion was that instead of finding them indirectly by first increasing the building industry by 500,000 men in order that 200,000 might be drawn from it, the 200,000 men should be drawn directly into a public cottage-building service. Such a service could, of course, only be built up gradually, and it might well be that a commencement should be made with specific trades such as bricklayers, plasterers, and slaters, the service extending as occasion demanded and opportunity offered. In raising such a labour service the following matters would demand attention: (1) The attraction of men into the service. (2) The fact that the need for new houses did not arise equally at all times in every part of the country, combined with the equally obvious fact that men grew tired of the journeyman's life and wanted to settle down. (3) The steady replenishment of the service.

The lecturer would, he said, limit the type of house to be erected by such a service to the "B" type, that was, the parlour house with three bedrooms, although perhaps allowing some increase in size, and he would restrain such a service from undertaking the erection of public buildings. Such restrictions would, no doubt, be necessary to secure the assent of employers and operatives in the main industry. With regard to the replenishment of the service when organised there would be no difficulty. On the estimate of a 25 years' life it would require the entrance of 8,000 men per annum to keep it at strength, and these could be easily furnished by the technical schools of the country, to which the prospect of a post in a public service would effectively attract a sufficient number of applicants.

In regard to materials, a cottage-building programme, if it were not to be upset by the fluctuations in demand made on materials by the main industry, must have its independent sources of supply. The materials required were few and simple—brick, stone, slate, tiles and timber were the chief. Of these brick, stone and tiles were local materials, and might be left to local provision. Slates were a national and timber an international supply. Their acquisition and distribution might be undertaken by a central authority.

In conclusion, there was no real difficulty in solving the housing problem; those that had arisen were due to the fact that persons whose enthusiasm had outrun their intelligence had rushed into enterprises, the extent of which they had not measured, with resources they had failed to estimate. To this had been added an ignorance of, or an indifference to, the collateral results of the policy they had been pursuing, hence the present position. The architect played an important part in regard to housing. He could help in the means that were to be employed, and the end that was to be achieved. Building was, or should be, a matter of appropriate arrangements of parts, soundness of construction, economy in cost, and beauty in result. None of those things could be fully achieved without the co-operation of the architect, and no sound housing policy would concern itself with the rest of the workmen and leave the chief workman out of account.

Discussion.

MR. FRANK M. ELGOOD, F.R.I.B.A., Chairman of the National Housing and Town-Planning Council, in moving a vote of thanks to Major Barnes, said his conclusions in regard to standard and cost were almost irresistible. One of the things they all realised was that they had to deal fairly constantly with an extraordinary reaction which overcame the public mind and hindered progress. To think that the Minister of Health should by any possible means have contemplated the possibility of providing public money for the erection of houses 40 to the acre was almost inconceivable. Architects, who had special knowledge, had constantly to be on the watch, even on those who were supposed to be the nation's custodians. The provision of a good house for the worker had never been an economical problem; he was perfectly certain the poor had never been properly housed. If they looked for an improved standard of housing and life in the future they had got to realise that housing must be subsidised. The outlook might be distasteful, but either they had to raise the workers' wages or subsidise the houses.

MR. ERNEST BROWN, M.P., in seconding the vote of thanks, said whatever people thought about the urban side of the problem those who understood the rural side would agree that the provision of houses on that side was bound to become a national problem.

MR. RAYMOND UNWIN, F.R.I.B.A., said with regard to the question of the maintenance of the standard of houses he entirely agreed. If they got away from the standard they got such a pitiful economic relief for their reduced area that it was not worth while. It was more economical in the long run to retain a reasonable standard of accommodation and size of rooms. The question of national service for building was a difficult problem. Some of them considered they could not have a national service in housing unless they had it in other industries.

MR. SIMON, M.P., said when Major Barnes mentioned there was no real difficulty in solving the housing problem he was utterly surprised. With the third contention of Major Barnes, "if they were going to maintain the standard set down it meant good-bye to private enterprise," he was even more surprised. They knew the economic conditions to-day, but five or ten years hence they would not know them. After the lessons of the past years they should be very chary of the future. They had to make up their minds that they must maintain private enterprise in order to build the maximum number of houses. There were two clear policies: Mr. MacDonald's policy against that of Mr. Neville Chamberlain and Dr. Addison. If they adopted the former they would, no doubt, be able to let houses to the poorest section of the working classes, but they must remember they were only going to build a relatively small number of houses during the next five years. The fundamental difference of opinion on the matter was whether new houses should be built for labour—which meant a £30 subsidy; or, alternatively, for the skilled artisan and upper working class. If they followed Mr. MacDonald they would very soon have such a revolt of the taxpayer that they would soon have a state of things similar to the Addison scheme. It was fatal to build houses to let at any very low rent; and there would be no great advantage from the point of view of public health. He was dead against the £500 house at a 9s. rent. If they let for 9s. it would mean that those in pre-war houses were going to pay nearly twice the amount of rent for a similar type of house. Was it desirable to have two levels of rent?

MR. GEORGE HICKS, Secretary, Amalgamated Union of Building Trade Workers, said in regard to cottage building he thought it would be a profound mistake to separate it from other forms of building. The building industry already provided opportunities for labour to do the class of building which the lecturer had described as cottage building. He would like to see a housing scheme of 200,000 houses a year fitted in with the general building programme of the country; the housing programme should be one of elasticity. The question of training labour was one the building employer found very difficult. Each time he (Mr. Hicks) put the question to the employers and asked them to extend their training facilities they spoke of the absence of any guarantees; without guarantees they could not accept the responsibility of continuous training in the variable circle of the trade. He considered a labour army for cottage building would not be an effective but a nondescript army. He agreed the standard for housing laid down by Major Barnes was the minimum that could be allowed. In regard to materials there was certainly a very great lack of organisation among manufacturers: in many parts of the country no organisation at all.

MR. H. R. SELLEY, President, National Federation of House Builders, said he spoke for private enterprise. The public had got the houses they deserved for the little assistance they had given to the builder 30 years ago. Major Barnes had referred glibly to the lower-paid artisan: it was difficult to know where to place the datum line. Speaking for private enterprise he looked on the question from an economic point of view: it was certainly still very much alive. If the principles of Major Barnes' paper came into operation, however, it would be dead in a fortnight. If they had 9s. houses at £500 the people who were thinking of 15s. houses would wait a little longer. He knew of nothing that would make better citizens than to give them a front garden and a mortgage. Let them pay £30 down and then settle down and pay the balance.

MR. EDWIN EVANS, Vice-Chairman, L.C.C. Housing Committee, said he would like the next paper of Major Barnes to deal with the financial side of the 200,000 a year housing scheme. They had talked about the standard of the houses, but no one had talked about the standard of the people who lived in the houses.

After SIR THEODORE CHAMBERS and MR. W. MC G. EAGAR, Secretary, Garden Cities and Town-Planning Association, had taken part in the discussion, MAJOR BARNES briefly responded.

Bank at Doncaster.

The general contractors for this building are H. Arnold & Son, of Doncaster; stonework, Bath and Portland Stone Firms; steelwork, Leonard Cooper, Ltd.; reinforcement, B.R.C.; metal windows, H. Hope; internal bronze and other metal work, Birmingham Guild, Ltd., and Geo. Wragge, Ltd.; stone and wood carving, G. & A. Brown, Ltd.; marble, J. Stubbs & Sons, 272, Crown-street, Liverpool. Mr. F. C. R. Palmer, F.R.I.B.A., is Surveyor, and Mr. W. F. C. Holden, A.R.I.B.A., Assistant Surveyor, to the National Provincial and Union Bank of England, Ltd.

House at Strensall.

Mr. C. W. Bowles, F.R.I.B.A., is the architect of the house at Strensall, Yorks.

"Vyse Court," Bishop's Stortford.

The old buildings, formerly used as a malthouse and kiln, were acquired from the adjoining owner, and these working drawings show the alterations that are being made to convert them into a billiard-room, offices, &c. The work is being done for Mr. J. H. Kerner-Greenwood, and all the flat roofs and damp-proof courses are of waterproofed concrete or cement mortar.

The architect is Mr. L. Edmund Walker, and the quantity surveyor Mr. Gilbert H. Burton, F.S.I., New Court, Lincoln's Inn, London, W.C. The contract has been placed with Messrs. W. Bell & Son, Saffron Walden.

Newcastle Concert Hall and Baths Competition.

We give this week the design placed first, by Messrs. Nicholas & Dixon-Spain, FF.R.I.B.A., in the Newcastle-on-Tyne Concert Hall and Baths Competition. The full result of this competition is given on p. 448. A review of the designs submitted is given on p. 449.

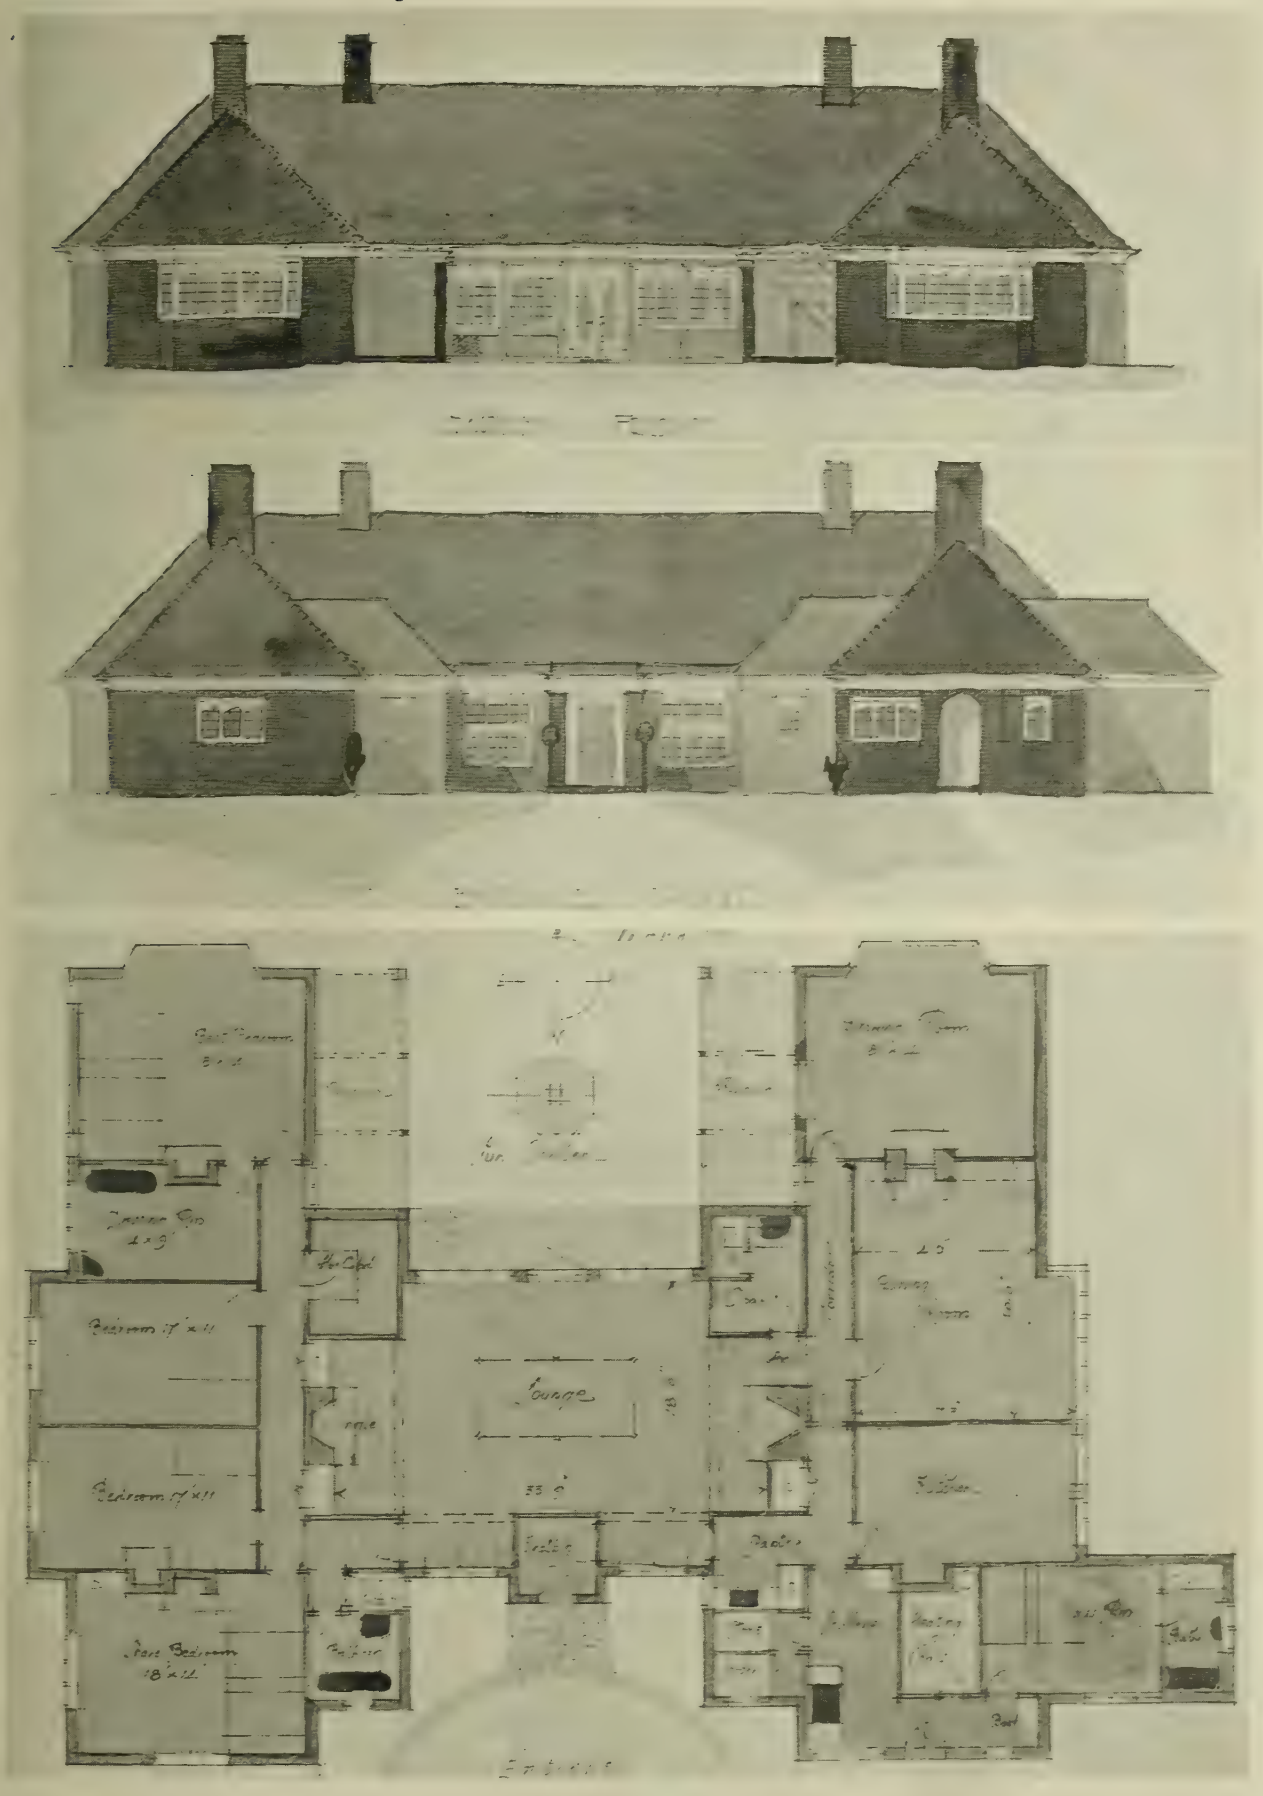
BOOK REVIEWS

Oxford: A Guide to Its History and Buildings. By G. R. STIRLING TAYLOR. (Longmans, Green & Co.) Price, 4s. net.

Oxford, like Cambridge, possesses an atmosphere of intellectual and scholastic culture which is, perhaps, difficult to define, but unquestionably exists and is quite distinguishable from that which pervades the great seats of learning on the Continent. This is probably to a great extent due to the residential character of the English universities. The University of Oxford has played so important a part in the development of the nation that an acquaintance with its history is essential to a thorough grasp of the history of England generally. We therefore welcome this little volume as a useful and instructive guide to the University and city. It is divided into three parts—history, itinerary, and illustrated descriptions.

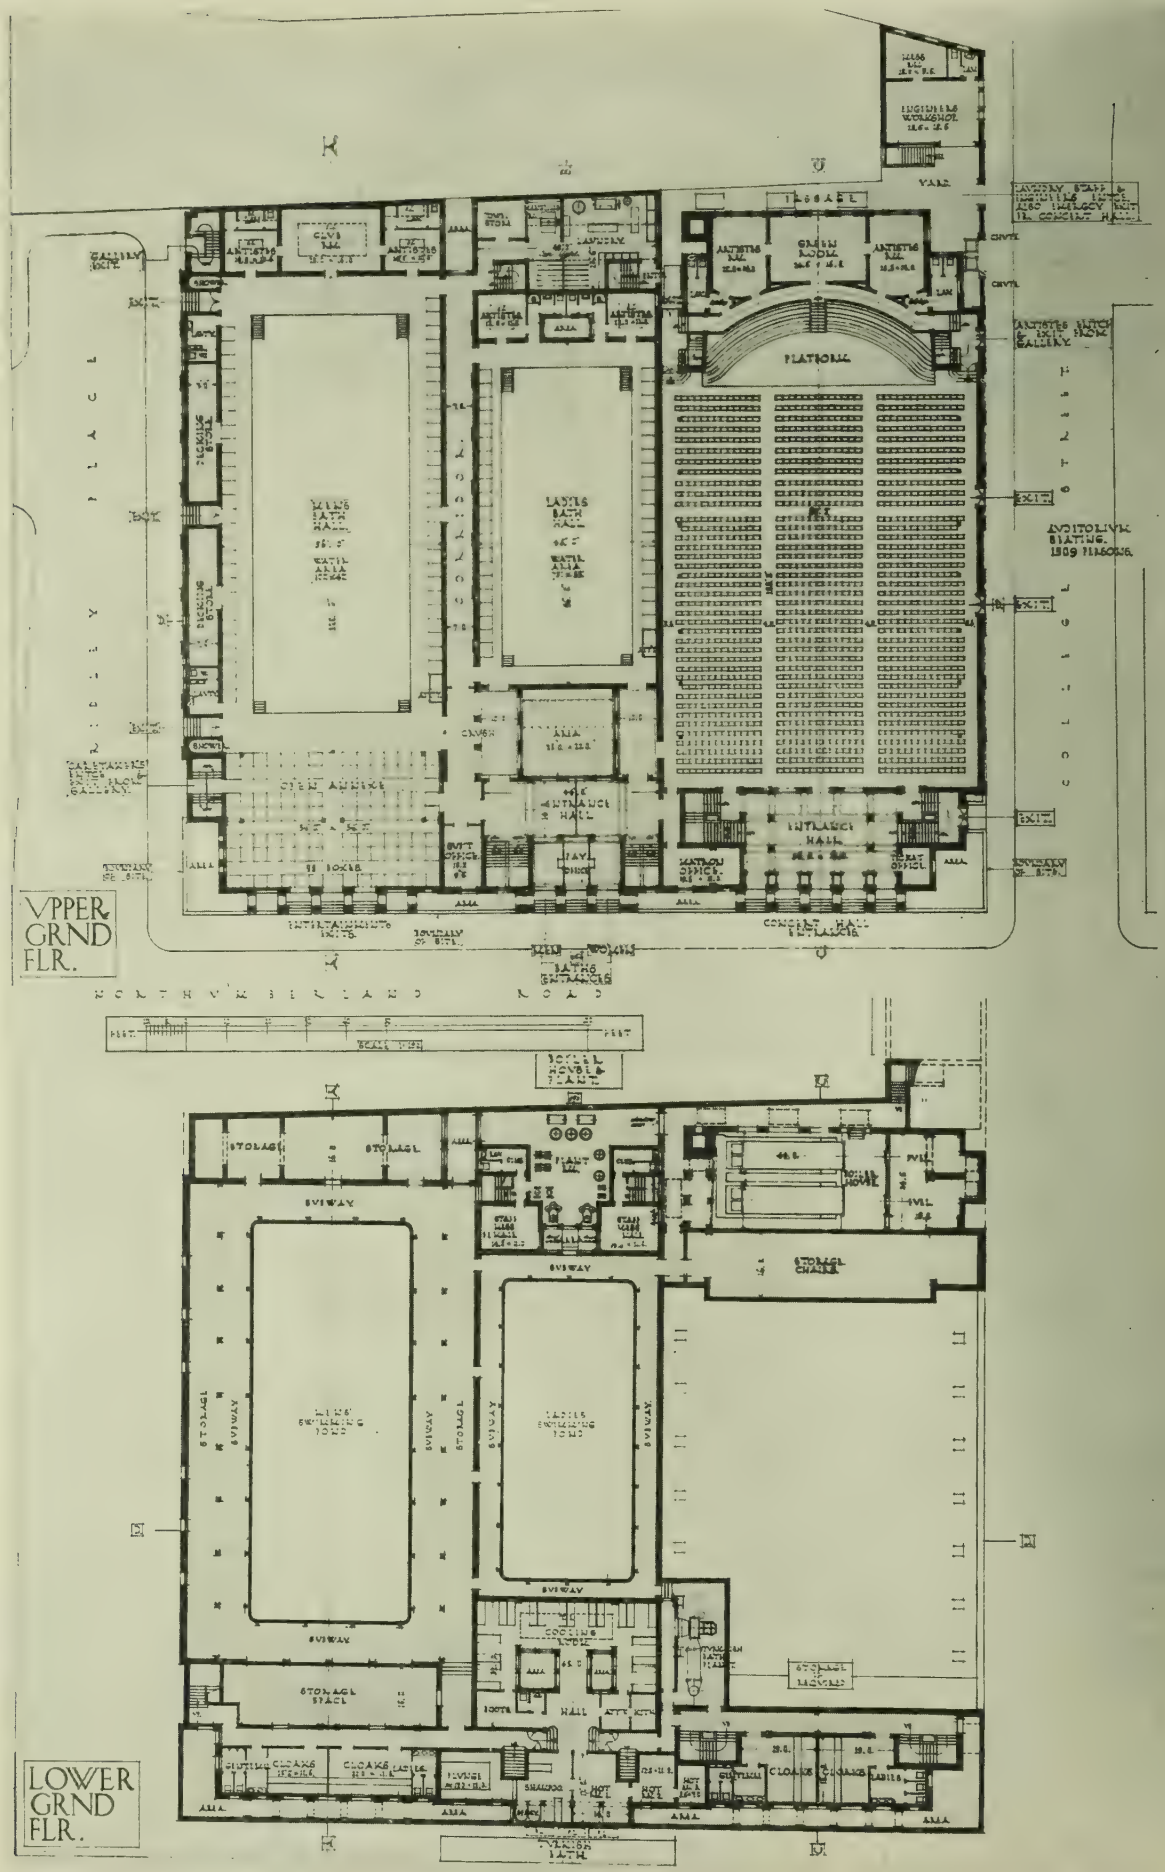


In the first part, the author has condensed into a small space a terse but interesting account of the historical development of the University and city—a difficult achievement. Both in the itinerary and the descriptive accounts, historical notes predominate and architectural description is chiefly confined to dates and reference to the architects responsible for the works mentioned. The full-page illustrations in the third part are clear and have the merit of being opposite to the descriptive text.

Social Survey. A Guide to Good Citizenship. By GEORGE PEVERETT and ALFRED T. FIKE. (National Adult School Union, 30, Bloomsbury-street, W.C.1.) Price 6d.

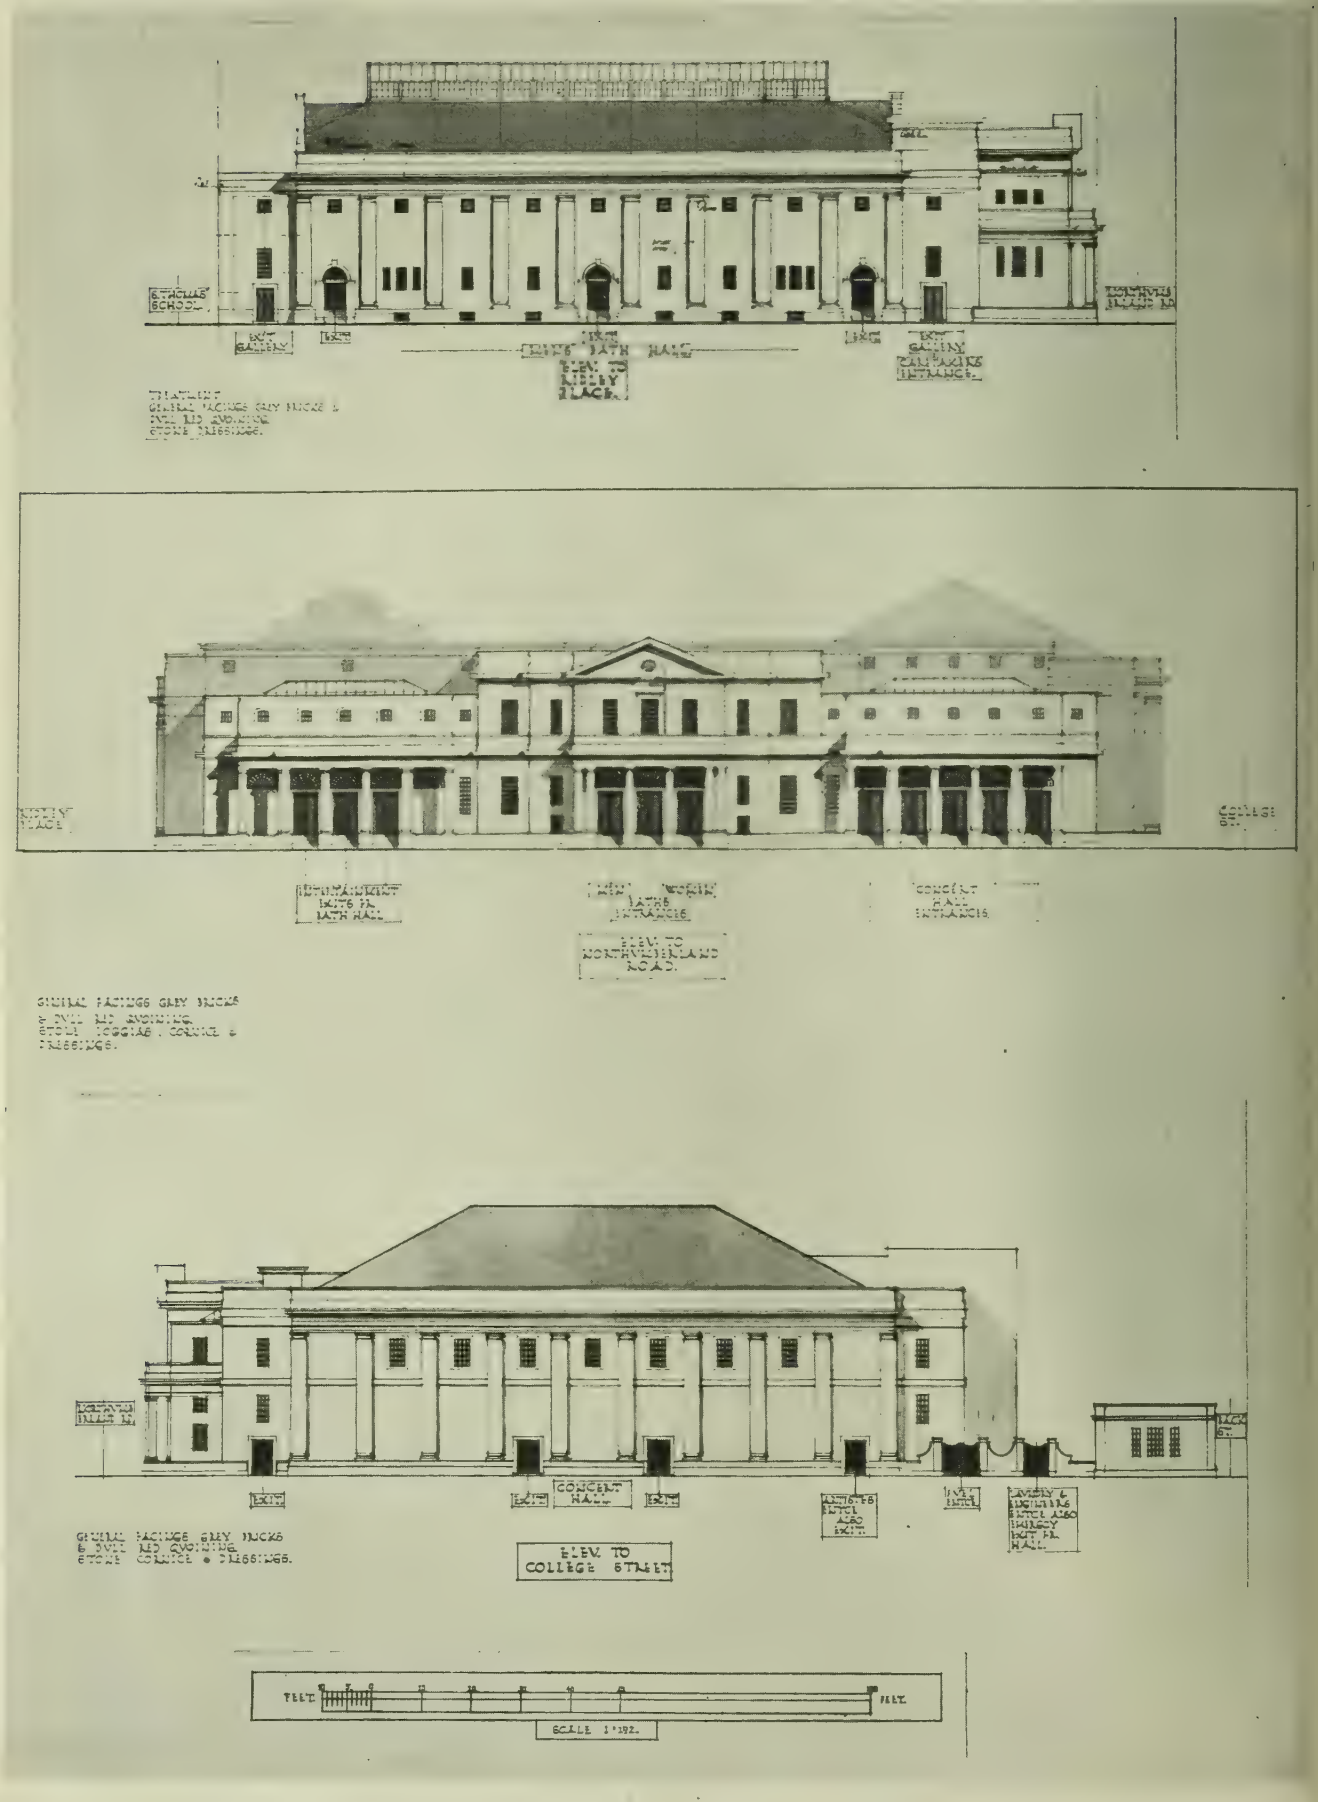
This short but stimulating little work is evidence of the growing responsibility in civic life. The present generation has no doubt of the answer it must make to the cry of Cain, and if the younger and coming generation does not also take up the challenge it will not be for want of encouragement or of excellent handrails, such as the pamphlet under review. The better side of the last century was pre-eminently philanthropic. Appalled by the consequences of the industrial revolution, but still influenced academically by the policy of *laissez-faire* men and women of goodwill poured their energies into works of remedial relief and great palliative measures. The present mood is not a direct sequence of the past; it depends for its inspiration less on benevolence than on a sense of justice or of resentment at injustice; it is fiery and hasty, with the defects of its qualities. Such publications as this Survey are exactly the corrective and the guide that is needed. It embodies a scheme to promote local surveys, and consists of twenty short chapters, each two or three pages long, compiled of pertinent questions on such subjects as Local Government, Child Life, Housing, Drink Traffic and Industry. The syllabus is admirably mapped out and should give the student, however young and infallible, not only some idea of the immensity of the canvas, but also an inspiration to induce him to persevere.

The Story of Golder's Green. By F. HOWKIN. (London: Ernest Owers, Golder's Green.) Price, 2s. 6d.; cloth, 5s.



The story of Golder's Green is fascinating and its development phenomenal. To residents it should appeal strongly. It is interesting to compare the view illustrated from an old print dated 1797 with developments of to-day. Four maps are given, dated as follows, 1796, 1865, 1907, and 1923, and it is on these that the history of the district can be traced. Some of the old buildings still remain, notably the "Old Swan" public house, a picturesque old weather-board building; and part of an old barn, a relic of Hodford Farm. Mutton Bridge, another relic, it is sad to note, is shortly to be demolished for road widening. The volume makes entertaining reading and should certainly be read by residents, who should know the history of their district.

Bungalow at Gerrard's Cross: Mr. Robert G. Muir, F.R.I.B.A., Architect.



[This bungalow contains six bedrooms and one dressing-room in addition to a maid's room. There is a spacious lounge and loggia with ample kitchen offices. The structure is to be in brick with tiled roofs. Mr. Robert G. Muir, F.R.I.B.A., of 1, Raymond-buildings, Grays Inn, is the architect.]
